## ANIMAL BREEDING NOTES

## CHAPTER 2

## LINEAR DEPENDENCE, MATRIX INVERSES, AND CONSISTENCY OF LINEAR EQUATIONS

## Linear dependence

Let $\left\{y_{1}, y_{2}, \ldots, y_{n}\right\}$ be a set of $\mathrm{n} m \times 1$ vectors. This set of n vectors is linearly dependent if there is a set of scalars $\left\{\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{n}}\right\}$ not all zero, such that

$$
\mathrm{c}_{1} \mathrm{y}_{1}+\mathrm{c}_{2} \mathrm{y}_{2}+\ldots+\mathrm{c}_{\mathrm{n}} \mathrm{y}_{\mathrm{n}}=0
$$

Contrarily, if the only set of scalars for which the above sum is $\{0,0, \ldots, 0\}$, the set of vectors $\left\{y_{1}, \ldots, y_{n}\right\}$ is linearly independent.

## Remarks:

1) Any set of vectors containing the zero vector is linearly dependent.
2) Any subset of a linearly independent set of vectors is linearly independent.
3) If a set contains more than $\mathrm{m} \mathrm{m} \times 1$ vectors, it is linearly dependent.

## Examples:

1) $y_{1}=\left[\begin{array}{r}0 \\ -2 \\ 6\end{array}\right], \quad y_{2}=\left[\begin{array}{r}5 \\ 10 \\ 8\end{array}\right], \quad y_{3}=\left[\begin{array}{l}0 \\ 3 \\ 1\end{array}\right]$

$$
c_{1}\left[\begin{array}{r}
0 \\
-2 \\
6
\end{array}\right]+c_{2}\left[\begin{array}{r}
5 \\
10 \\
8
\end{array}\right]+c_{3}\left[\begin{array}{l}
0 \\
3 \\
1
\end{array}\right]=\left[\begin{array}{r}
5 c_{2} \\
-2 c_{1}+10 c_{2}+3 c_{3} \\
6 c_{1}+8 c_{2}+c_{3}
\end{array}\right]
$$

The set $\left\{\mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}\right\}$ is linearly independent because $\sum_{i=1}^{3} \mathrm{c}_{1} \mathrm{y}_{\mathrm{i}}=0$ only if $\mathrm{c}_{1}=\mathrm{c}_{2}=\mathrm{c}_{3}=0$.
2) $\mathrm{x}_{1}=\left[\begin{array}{r}0 \\ -2 \\ 6\end{array}\right], \quad \mathrm{x}_{2}=\left[\begin{array}{r}5 \\ 10 \\ 8\end{array}\right], \quad \mathrm{x}_{3}=\left[\begin{array}{r}0 \\ 1 \\ -3\end{array}\right]$

The set $\left\{\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{3}\right\}$ is linearly dependent because $\mathrm{x}_{1}+2 \mathrm{x}_{3}=0$.
Rank of a matrix: The columns of a matrix $\mathrm{A}_{\mathrm{m} \times \mathrm{n}}$ can be considered as a set of vectors (i.e., column vectors). Similarly, the rows of a matrix $\mathrm{A}_{\mathrm{m} \times \mathrm{n}}$ constitute a set of row vectors. The rank of a matrix $A_{m \times n}$ is the number of linearly independent column vectors (column rank) or row vectors (row rank). The row rank and the column rank of a matrix are equal.

## Remarks:

1) The rank of $A_{m \times n}, m \neq n \leq \min (m, n)$.
[Note: $\operatorname{rank}(\mathrm{A})=\operatorname{rank}\left(\mathrm{A}^{\prime}\right)$ ]
2) The rank of $\mathrm{AB} \leq \min (\operatorname{rank} \mathrm{A}, \operatorname{rank} \mathrm{B})$.
3) The rank of a square matrix is equal to or less than its order.
4) The rank of $(A \oplus B)=\operatorname{rank}$ of $A+\operatorname{rank}$ of $B$.
5) The following statements are equivalent for a nonsingular (square) matrix $A_{n}$ :
a) $\mathrm{Ax}=0 \Rightarrow \mathrm{x}=0$, and
b) $|\mathrm{A}| \neq 0$.
6) For $\mathrm{D}=$ diagonal matrix, rank $(\mathrm{D})=$ number of nonzero elements. In particular, rank $\left(\mathrm{I}_{\mathrm{n}}\right)=\mathrm{n}$.

## Examples:

1) The matrix $A_{3}=\left[\begin{array}{rrr}0 & 5 & 0 \\ -2 & 10 & 3 \\ 6 & 8 & 1\end{array}\right]$ has rank $=3$ (i.e., it is nonsingular) because:
a) $\mathrm{Ax}=0 \Rightarrow \mathrm{x}=\left[\begin{array}{lll}0 & 0 & 0\end{array}\right]^{\prime}$
b) $|\mathrm{A}|=5\left|\begin{array}{rr}-2 & 3 \\ 6 & 1\end{array}\right|(-1)^{3}=100$
2) The matrix $B_{3}=\left[\begin{array}{rrr}0 & 5 & 0 \\ -2 & 10 & 1 \\ 6 & 8 & -3\end{array}\right]$ has rank $=2$ (i.e., it is singular) because:
a) $B x=0$ for $x=\left[\begin{array}{lll}1 & 0 & 2\end{array}\right]^{\prime}$
b) $|\mathrm{B}|=5\left|\begin{array}{rr}-2 & 1 \\ 6 & -3\end{array}\right|(-1)^{3}=-5(0)=0$
c) If the first or the third columns are ignored the remaining columns are linearly independent.

Inverse of a matrix: The matrix $B$ such that $A B=B A=I$ is called the inverse of $A$ and it is denoted by $\mathrm{A}^{-1}$. The inverse is defined only for square matrices.

## Remarks:

1) The matrix $A$ has an inverse if it is nonsingular, i.e.,

$$
\mathrm{A}^{-1} \text { exists } \Rightarrow\left\{\begin{array}{l}
\mathrm{Ax}=0 \Rightarrow \mathrm{x}=0 \\
|\mathrm{~A}| \neq 0
\end{array}\right.
$$

2) $\mathrm{A}^{-1}$ is unique.
3) $\left(\mathrm{A}^{-1}\right)^{-1}=\mathrm{A}$
4) $\left(\mathrm{A}^{\prime}\right)^{-1}=\left(\mathrm{A}^{-1}\right)^{\prime}$
5) If A is symmetric (i.e., $\mathrm{A}^{\prime}=\mathrm{A}$ ), then $\mathrm{A}^{-1}$ is also symmetric (i.e., $\left.\left(\mathrm{A}^{-1}\right)^{\prime}=\mathrm{A}^{-1}\right)$.
6) If A and B are nonsingular, then $(\mathrm{AB})^{-1}=\mathrm{B}^{-1} \mathrm{~A}^{-1}$
7) If $\mathrm{A}^{-1}=\mathrm{A}^{\prime}$ then $\mathrm{AA}^{\prime}=\mathrm{I} \Rightarrow \mathrm{A} \equiv$ orthogonal matrix.
8) $(\mathrm{A} \oplus \mathrm{B})^{-1}=\mathrm{A}^{-1} \oplus \mathrm{~B}^{-1}$
9) $(\mathrm{A} * \mathrm{~B})^{-1}=\mathrm{A}^{-1} * \mathrm{~B}^{-1}$
10) $\mathrm{D}=\operatorname{diag}\left\{\mathrm{d}_{\mathrm{ii}}\right\} \Rightarrow \mathrm{D}^{-1}=\left\{\frac{1}{d_{i i}}\right\}$.

## Computation of the inverse of a matrix

$$
\mathrm{A}^{-1}=|\mathrm{A}|^{-1} \operatorname{adj}(\mathrm{~A})
$$

where

$$
\begin{aligned}
|\mathrm{A}| & =\text { Determinant of the matrix } \mathrm{A} \\
\operatorname{adj}(\mathrm{~A}) & =\text { Transposed matrix of cofactors of the elements of } \mathrm{A} \\
& =\text { adjugate or adjoint of } \mathrm{A}
\end{aligned}
$$

## Example:

a) $\mathrm{A}_{2 \times 2}=\left[\begin{array}{ll}6 & 2 \\ 4 & 5\end{array}\right] \Rightarrow \mathrm{A}^{-1}=\frac{1}{22}\left[\begin{array}{rr}5 & -2 \\ -4 & 6\end{array}\right]$
b) $\mathrm{A}_{3 \times 3}=\left[\begin{array}{lll}3 & 2 & 1 \\ 2 & 4 & 0 \\ 1 & 0 & 6\end{array}\right]$
$|\mathrm{A}|=1\left|\begin{array}{ll}2 & 1 \\ 4 & 0\end{array}\right|(-1)^{3+1}+6\left|\begin{array}{ll}3 & 2 \\ 2 & 4\end{array}\right|(-1)^{3+3}=-4+48=44$

$$
\begin{aligned}
& \Rightarrow \mathrm{A}^{-1}=\frac{1}{44}\left[\begin{array}{c}
\left|\begin{array}{ll}
4 & 0 \\
0 & 6
\end{array}\right| \\
-\left|\begin{array}{ll}
2 & 0 \\
1 & 6
\end{array}\right| \\
-\left|\begin{array}{ll}
2 & 1 \\
0 & 6
\end{array}\right| \\
1
\end{array}\left|\begin{array}{ll}
2 & 4 \\
1
\end{array}\right|\right]\left[\begin{array}{ll}
3 & 1 \\
1 & 6
\end{array}\left|-\left|\begin{array}{ll}
3 & 2 \\
1 & 0
\end{array}\right|\right]\right. \\
& \Rightarrow \quad \mathrm{A}^{-1}=\frac{1}{44}\left[\begin{array}{rrr}
24 & -12 & -4 \\
-12 & 17 & 2 \\
-4 & 2 & 8
\end{array}\right] \\
& \Rightarrow \mathrm{AA}^{-1}=\left[\begin{array}{lll}
3 & 2 & 1 \\
2 & 4 & 0 \\
1 & 0 & 6
\end{array}\right] \frac{1}{44}\left[\begin{array}{rrr}
24 & -12 & -4 \\
-12 & 17 & 2 \\
-4 & 2 & 8
\end{array}\right] \\
& =\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]
\end{aligned}
$$

## Inversion of a matrix by partitioning

If a nonsingular matrix $A$ is too large to be directly inverted in a computer, its inverse (i.e., $\mathrm{A}^{-1}$ ) could be obtained by partitioning A into four submatrices, i.e.,

$$
\mathrm{A}=\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right] \text { where } \mathrm{A}_{11} \text { and } \mathrm{A}_{22} \text { are square matrices. }
$$

Let

$$
A^{-1}=\left[\begin{array}{ll}
A^{11} & A^{12} \\
A^{21} & A^{22}
\end{array}\right] .
$$

Note that:

$$
\begin{align*}
& {\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right]\left[\begin{array}{ll}
\mathrm{A}^{11} & \mathrm{~A}^{12} \\
\mathrm{~A}^{21} & \mathrm{~A}^{22}
\end{array}\right]=\left[\begin{array}{ll}
\mathrm{I} & 0 \\
0 & \mathrm{I}
\end{array}\right] } \\
& \Rightarrow \quad \mathrm{A}_{11} \mathrm{~A}^{11}+\mathrm{A}_{12} \mathrm{~A}^{21}=\mathrm{I}  \tag{1}\\
& \mathrm{~A}_{11} \mathrm{~A}^{12}+\mathrm{A}_{12} \mathrm{~A}^{22}=0  \tag{2}\\
& \mathrm{~A}_{21} \mathrm{~A}^{11}+\mathrm{A}_{22} \mathrm{~A}^{21}=0  \tag{3}\\
& \mathrm{~A}_{21} \mathrm{~A}^{12}+\mathrm{A}_{22} \mathrm{~A}^{22}=\mathrm{I} \tag{4}
\end{align*}
$$

Assuming that $\mathrm{A}_{11}$ and $\mathrm{A}_{22}$ are nonsingular, using [1], [2], [3], and [4], we get:

$$
\begin{align*}
& \text { from [2]: } \mathrm{A}^{12}=-\mathrm{A}_{11}^{-1} \mathrm{~A}_{12} \mathrm{~A}^{22}  \tag{5}\\
& \text { from [3]: } \mathrm{A}^{21}=-\mathrm{A}_{22}^{-1} \mathrm{~A}_{21} \mathrm{~A}^{11} \tag{6}
\end{align*}
$$

Substituting [6] in [1] and [5] in [4] we get:

$$
\begin{align*}
\mathrm{A}_{11} \mathrm{~A}^{11}+\mathrm{A}_{12}\left(-\mathrm{A}_{22}^{-1} \mathrm{~A}_{21} \mathrm{~A}^{11}\right) & =\mathrm{I} \\
\left(\mathrm{~A}_{11}-\mathrm{A}_{12} \mathrm{~A}_{22}^{-1} \mathrm{~A}_{21}\right) \mathrm{A}^{11} & =\mathrm{I} \\
\Rightarrow \quad \mathrm{~A}^{11} & =\left(\mathrm{A}_{11}-\mathrm{A}_{12} \mathrm{~A}_{22}{ }^{-1} \mathrm{~A}_{21}\right)^{-1} \tag{7}
\end{align*}
$$

and

$$
\begin{array}{rlrl}
\mathrm{A}_{21}\left(-\mathrm{A}_{11}{ }^{-1} \mathrm{~A}_{12} \mathrm{~A}^{22}\right)+\mathrm{A}_{22} \mathrm{~A}^{22} & =\mathrm{I} \\
\Rightarrow \quad & & \mathrm{~A}^{22} & =\left(\mathrm{A}_{22}-\mathrm{A}_{21} \mathrm{~A}_{11}{ }^{-1} \mathrm{~A}_{12}\right)^{-1} \tag{8}
\end{array}
$$

This approach requires inverting four matrices: $\mathrm{A}_{11}, \mathrm{~A}_{22},\left(\mathrm{~A}_{11}-\mathrm{A}_{12} \mathrm{AA}_{21}\right)$ and $\left(\mathrm{A}_{22}-\mathrm{A}_{21} \mathrm{AA}_{12}\right)$. A procedure that requires inverting only two matrices is as follows. Recall that:

$$
\left[\begin{array}{ll}
\mathrm{A}^{11} & \mathrm{~A}^{12} \\
\mathrm{~A}^{21} & \mathrm{~A}^{22}
\end{array}\right]\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right]=\left[\begin{array}{ll}
\mathrm{I} & 0 \\
0 & \mathrm{I}
\end{array}\right]
$$

Thus,

$$
\begin{equation*}
\Rightarrow \quad \mathrm{A}^{11} \mathrm{~A}_{11}+\mathrm{A}^{12} \mathrm{~A}_{21} \quad=\mathrm{I} \tag{9}
\end{equation*}
$$

$$
\begin{align*}
& \mathrm{A}^{11} \mathrm{~A}_{12}+\mathrm{A}^{12} \mathrm{~A}_{22}=0  \tag{10}\\
& \mathrm{~A}^{21} \mathrm{~A}_{11}+\mathrm{A}^{22} \mathrm{~A}_{21}=0  \tag{11}\\
& \mathrm{~A}^{21} \mathrm{~A}_{12}+\mathrm{A}^{22} \mathrm{~A}_{22}=\mathrm{I}
\end{align*}
$$

From [10]:

$$
\begin{equation*}
\mathrm{A}^{12}=-\mathrm{A}^{11} \mathrm{~A}_{12} \mathrm{~A}_{22}^{-1} \tag{13}
\end{equation*}
$$

From [12]:

$$
\begin{align*}
\mathrm{A}^{22} & =\left(\mathrm{I}-\mathrm{A}^{21} \mathrm{~A}_{12}\right) \mathrm{A}_{22}{ }^{-1} \\
\mathrm{~A}^{22} & =\mathrm{A}_{22}-1-\mathrm{A}^{21} \mathrm{~A}_{12} \mathrm{~A}_{22}{ }^{-1}  \tag{14}\\
\Rightarrow \quad\left[\begin{array}{ll}
\mathrm{A}^{11} & \mathrm{~A}^{12} \\
\mathrm{~A}^{21} & \mathrm{~A}^{22}
\end{array}\right] & =\left[\begin{array}{rr}
\left(\mathrm{A}_{11}-\mathrm{A}_{12} \mathrm{~A}_{22}^{-1} \mathrm{~A}_{21}\right)^{-1} & -\mathrm{A}^{11} \mathrm{~A}_{12} \mathrm{~A}_{22}^{-1} \\
-\mathrm{A}_{22}^{-1} \mathrm{~A}_{21} \mathrm{~A}^{11} & \mathrm{~A}_{22}^{-1}-\mathrm{A}^{21} \mathrm{~A}_{12} \mathrm{~A}_{22}^{-1}
\end{array}\right] \tag{15}
\end{align*}
$$

Remark: Matrix [15] requires the existence of $\mathrm{A}_{22}{ }^{-1}$.
Similarly, from [11] and [9], we get:

$$
\begin{equation*}
\mathrm{A}^{21}=-\mathrm{A}^{22} \mathrm{~A}_{21} \mathrm{~A}_{11}{ }^{-1} \tag{16}
\end{equation*}
$$

and

$$
\begin{align*}
\mathrm{A}^{11} & =\left(\mathrm{I}-\mathrm{A}^{12} \mathrm{~A}_{21}\right) \mathrm{A}_{11}^{-1} \\
\mathrm{~A}^{11} & =\mathrm{A}_{11}^{-1}-\mathrm{A}^{12} \mathrm{~A}_{21} \mathrm{~A}_{11}^{-1}  \tag{17}\\
\Rightarrow \quad\left[\begin{array}{ll}
\mathrm{A}^{11} & \mathrm{~A}^{12} \\
\mathrm{~A}^{21} & \mathrm{~A}^{22}
\end{array}\right] & =\left[\begin{array}{rr}
\mathrm{A}_{11}^{-1}-\mathrm{A}^{12} \mathrm{~A}_{21} \mathrm{~A}_{11}^{-1} & -\mathrm{A}_{11}^{-1} \mathrm{~A}_{12} \mathrm{~A}^{22} \\
-\mathrm{A}^{22} \mathrm{~A}_{21} \mathrm{~A}_{11}^{-1} & \left(\mathrm{~A}_{22}-\mathrm{A}_{21} \mathrm{~A}_{11}^{-1} \mathrm{~A}_{12}\right)^{-1}
\end{array}\right] \tag{18}
\end{align*}
$$

Remark: Matrix $\mathrm{A}_{11}{ }^{-1}$ must exist if $\mathrm{A}^{-1}$ is to be computed using [18].
Expressions for obtaining the inverse of a symmetric matrix by partitioning are similar to [15] and [18], with $A_{12}{ }^{\prime}$ and $A^{12 \prime}$ substituted for $A_{21}$ and $A^{21}$.

## Example:

$$
A_{3 \times 3}=\left[\begin{array}{cccc}
3 & \mid & 2 & 1 \\
-- & \mid & ---- \\
2 & \mid & 4 & 0 \\
1 & \mid & 0 & 6
\end{array}\right]
$$

Let

$$
\mathrm{A}_{11}=[3], \mathrm{A}_{12}=\left[\begin{array}{ll}
2 & 1
\end{array}\right], \mathrm{A}_{21}=\mathrm{A}_{12},=\left[\begin{array}{l}
2 \\
1
\end{array}\right] \text {, and } \mathrm{A}_{22}=\left[\begin{array}{ll}
4 & 0 \\
0 & 6
\end{array}\right]
$$

By matrix formulae [15],

$$
\left.\left.\begin{array}{rl}
\mathrm{A}^{11} & =\left[[3]-\left[\begin{array}{ll}
2 & 1
\end{array}\right]\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
0 & \frac{1}{6}
\end{array}\right]\left[\begin{array}{l}
2 \\
1
\end{array}\right]\right]^{-1} \\
A^{11} & =\left[[3]-\left[\begin{array}{ll}
\frac{1}{2} & \frac{1}{6}
\end{array}\right]\left[\begin{array}{l}
2 \\
1
\end{array}\right]\right]^{-1}=\left[3-\frac{7}{6}\right]^{-1}=\left[\frac{6}{11}\right] \\
A^{12} & =-\left[\frac{6}{11}\right]\left[\left[\begin{array}{ll}
\frac{1}{2} & \frac{1}{6}
\end{array}\right]=-\left[\frac{3}{11}\right.\right. \\
\frac{1}{11}
\end{array}\right]=\mathrm{A}^{12 \prime}\right]\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
0 & \frac{1}{6}
\end{array}\right]-\left[\begin{array}{cc}
-\frac{3}{11} \\
-\frac{1}{11}
\end{array}\right]\left[\begin{array}{ll}
2 & 1
\end{array}\right]\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
0 & \frac{1}{6}
\end{array}\right]=\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
A^{22} & =\left[\begin{array}{ll}
\frac{3}{11} & \frac{3}{11} \\
\frac{2}{11} & \frac{1}{11}
\end{array}\right]\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
0 & \frac{1}{6}
\end{array}\right]=\left[\begin{array}{ll}
\frac{1}{4} & 0 \\
0 & \frac{1}{6}
\end{array}\right]+\left[\begin{array}{ll}
\frac{3}{22} & \frac{1}{22} \\
\frac{1}{22} & \frac{1}{66}
\end{array}\right]
\end{array}\right.
$$

$$
\begin{aligned}
\mathrm{A}^{22} & =\left[\begin{array}{cc}
\frac{17}{44} & \frac{1}{22} \\
\frac{1}{22} & \frac{2}{11}
\end{array}\right] \\
\Rightarrow \mathrm{A}^{-1} & =\left[\begin{array}{rrrr}
\frac{6}{11} & \mid & -\frac{3}{11} & -\frac{1}{11} \\
--- & \mid & --- & --- \\
-\frac{3}{11} & \mid & \frac{17}{44} & \frac{1}{22} \\
-\frac{1}{11} & \mid & \frac{1}{22} & \frac{2}{11}
\end{array}\right]=\frac{1}{44}\left[\begin{array}{r|rr}
24 & \mid & -12 \\
-\cdots & -4 \\
---12 & \mid & 17 \\
-\cdots-r^{2} \\
-4 & \mid & 2
\end{array}\right]
\end{aligned}
$$

## Elementary operators

Elementary operators are square matrices derived from the identity matrix. The rank of the matrix resulting from multiplying an elementary operator by a matrix $A_{m \times n}$ is the same as the rank of A.

The elementary operators are:
a) $E_{i j}$ is I with rows $i$ and $j$ interchanged, e.g.,

$$
\mathrm{E}_{13}=\left[\begin{array}{lll}
0 & 0 & 1 \\
0 & 1 & 0 \\
1 & 0 & 0
\end{array}\right]
$$

b) $\quad \mathrm{R}_{\mathrm{ii}}(\lambda)$ is I with $\lambda$ substituted for 1 in the $\mathrm{i}^{\text {th }}$ diagonal element, e.g.,

$$
\mathrm{R}_{11}(2)=\left[\begin{array}{ccc}
2 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]
$$

c) $\quad P_{i j}(\lambda)$ is I with $\lambda$ replacing for 0 in the $i^{\text {th }}$ location for $i \neq j$, e.g.,

$$
\mathrm{P}_{12}(2)=\left[\begin{array}{ccc}
1 & 2 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]
$$

## Effect of elementary operators on $\mathbf{A}_{\mathbf{m} \times \mathbf{n}}$

Pre-multiplication of A by an elementary operator affects the rows of A. Post-multiplication of A by an elementary operator affects the columns of A.

## Pre-multiplication of A by:

a) $\quad E_{i j}$ interchanges the $i^{\text {th }}$ and $j^{\text {th }}$ rows, e.g.,

$$
\begin{gathered}
\mathrm{E}_{13} \\
{\left[\begin{array}{ccc}
0 & 0 & 1 \\
0 & 1 & 0 \\
1 & 0 & 0
\end{array}\right]\left[\begin{array}{ccc}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{array}\right]=\left[\begin{array}{ccc}
\mathrm{E}_{13} \mathrm{~A} \\
{\left[\begin{array}{ccc}
7 & 8 & 9 \\
4 & 5 & 6 \\
1 & 2 & 3
\end{array}\right]}
\end{array}\right.}
\end{gathered}
$$

b) $\quad \mathrm{R}_{\mathrm{ii}}(\lambda)$ multiples the $\mathrm{i}^{\text {th }}$ row by $\lambda$, e.g.,

$$
\begin{gathered}
\mathrm{R}_{11}(2) \\
{\left[\begin{array}{ccc}
2 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{lll}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{array}\right]=\left[\begin{array}{ccc}
\mathrm{R}_{11}(2) \mathrm{A} \\
{\left[\begin{array}{lll}
2 & 4 & 6 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{array}\right]}
\end{array}\right.}
\end{gathered}
$$

c) $\quad P_{i j}(\lambda)$ adds $\lambda$ times the $j^{\text {th }}$ row to the $i^{\text {th }}$ row of $A$, e.g.,

$$
\begin{aligned}
& \mathrm{P}_{12} \text { (2) } \mathrm{A} \quad \mathrm{P}_{12}(2) \mathrm{A} \\
& {\left[\begin{array}{lll}
1 & 2 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{lll}
1 & 2 & 3 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{array}\right]=\left[\begin{array}{rrr}
9 & 12 & 15 \\
4 & 5 & 6 \\
7 & 8 & 9
\end{array}\right]}
\end{aligned}
$$

Determinants, transposes and inverses of elementary operators

| Determinant |  | Transpose | Inverse |
| :--- | :--- | :--- | :--- |
| $\left\|\mathrm{E}_{\mathrm{ij}}\right\|=-1$ | $\left\|\mathrm{E}_{\mathrm{ij}} \mathrm{A}\right\|=-\|\mathrm{A}\|$ | $\mathrm{E}_{\mathrm{ij}}{ }^{\prime}=\mathrm{E}_{\mathrm{ij}}$ | $\mathrm{E}_{\mathrm{ij}}{ }^{-1}=\mathrm{E}_{\mathrm{ij}}$ |
| $\left\|\mathrm{R}_{\mathrm{ij}}(\lambda)\right\|=\lambda$ | $\left\|\mathrm{R}_{\mathrm{ii}}(\lambda) \mathrm{A}\right\|=\lambda\|\mathrm{A}\|$ | $\mathrm{R}_{\mathrm{ij}}{ }^{\prime}(\lambda)=\mathrm{R}_{\mathrm{ii}}(\lambda)$ | $\left[\mathrm{R}_{\mathrm{ii}}(\lambda)\right]^{-1}=\mathrm{R}_{\mathrm{ii}}\left(\frac{l}{\lambda}\right)$ |
| $\left\|\mathrm{P}_{\mathrm{ij}}(\lambda)\right\|=1$ | $\left\|\mathrm{P}_{\mathrm{ij}}(\lambda) \mathrm{A}\right\|=\|\mathrm{A}\|$ | $\left[\mathrm{P}_{\mathrm{ij}}(\lambda)\right]=\mathrm{P}_{\mathrm{ij}}(\lambda)$ | $\left[\mathrm{P}_{\mathrm{ij}}(\lambda)\right]^{-1}=\mathrm{P}_{\mathrm{ij}}(-\lambda)$ |

## Reduction of a matrix to its equivalent diagonal form

Equivalence: two matrices are equivalent if one can be derived from the other by multiplying it by a series of elementary operators, i.e., a matrix $B_{m n}$ is equivalent to a matrix $A_{m n}$ if

$$
\mathrm{P}_{\mathrm{u}} \ldots \mathrm{P}_{2} \mathrm{P}_{1} \mathrm{AQ}_{1} \mathrm{Q}_{2} \ldots \mathrm{Q}_{\mathrm{v}}=\mathrm{B}
$$

where the $P_{i}, i=1, \ldots, u$ and $Q_{j}, j=1, \ldots, v$ are elementary operators. Let

$$
\mathrm{P}=\mathrm{P}_{\mathrm{u}} \ldots \mathrm{P}_{2} \mathrm{P}_{1} \text { and } \mathrm{Q}=\mathrm{Q}_{1} \mathrm{Q}_{2} \ldots \mathrm{Q}_{\mathrm{v}}
$$

where
P and $\left\{\mathrm{P}_{\mathrm{i}}\right\}$ are $\mathrm{m} \times \mathrm{n}$ and Q and $\left\{\mathrm{Q}_{\mathrm{j}}\right\}$ are $\mathrm{n} \times \mathrm{m}$ nonsingular matrices. Thus,

$$
\mathrm{A}=\mathrm{P}^{-1} \mathrm{BQ}^{-1}
$$

where

$$
\begin{aligned}
& \mathrm{P}^{-1}=\mathrm{P}_{1}^{-1} \ldots \mathrm{P}_{\mathrm{u}-1}^{-1} \mathrm{P}_{\mathrm{u}}^{-1} \\
& \mathrm{Q}^{-1}=\mathrm{Q}_{\mathrm{v}}{ }^{-1} \ldots \mathrm{Q}_{2}^{-1} \mathrm{Q}_{1}^{-1}
\end{aligned}
$$

which are also elementary operators. Thus, B is equivalent to A and A is equivalent to B . In addition, because multiplication of matrices by elementary operators does not change their rank, $\operatorname{rank}(\mathrm{A})=\operatorname{rank}(\mathrm{B})$.

## Equivalent diagonal form

$$
\mathrm{D}=\left[\begin{array}{rr}
\mathrm{D}_{\mathrm{r}} & 0 \\
0 & 0
\end{array}\right]
$$

Note: the rank of a matrix $\mathrm{A}_{\mathrm{mn}}$ can be obtained by obtaining an equivalent matrix B whose subdiagonal elements are zero.

## Examples:

1) Reduction of $\mathrm{A}_{33}$ to D

$$
\begin{aligned}
& A=\left[\begin{array}{lll}
8 & 4 & 2 \\
4 & 6 & 1 \\
2 & 1 & 4
\end{array}\right] \\
& P_{2} P_{1}=\left[\begin{array}{ccc}
1 & 0 & 0 \\
-\frac{1}{2} & 1 & 0 \\
-\frac{1}{4} & 0 & 1
\end{array}\right] \Rightarrow P_{2} P_{1} A=\left[\begin{array}{ccc}
8 & 4 & 2 \\
0 & 4 & 0 \\
0 & 0 & \frac{7}{2}
\end{array}\right] \Rightarrow \operatorname{rank}(A)=3
\end{aligned}
$$

2) Reduction of $A_{33}$ to $D$

$$
A=\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right]
$$

$$
\begin{align*}
& P_{2} P_{1}=\left[\begin{array}{rrr}
1 & 0 & 0 \\
-\frac{2}{3} & 1 & 0 \\
-\frac{1}{3} & 0 & 1
\end{array}\right] \Rightarrow P_{2} P_{1} A=\left[\begin{array}{ccc}
6 & 4 & 2 \\
0 & \frac{4}{3} & -\frac{4}{3} \\
0 & -\frac{4}{3} & \frac{4}{3}
\end{array}\right]  \tag{2-13}\\
& \mathrm{P}_{3} \mathrm{P}_{2} \mathrm{P}_{1} \mathrm{~A}=\left[\begin{array}{ccc}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 1 & 1
\end{array}\right]\left[\begin{array}{ccc}
6 & 4 & 2 \\
0 & \frac{4}{3} & -\frac{4}{3} \\
0 & -\frac{4}{3} & \frac{4}{3}
\end{array}\right]=\left[\begin{array}{ccc}
6 & 4 & 2 \\
0 & \frac{4}{3} & -\frac{4}{3} \\
0 & 0 & 0
\end{array}\right]
\end{align*}
$$

Because $A$ is symmetric $Q_{i}=P_{i}{ }^{\prime}$; thus, $\mathbf{Q}_{1} \mathbf{Q}_{2} \mathbf{Q}_{3}=P_{1}{ }^{\prime} \mathbf{P}_{\mathbf{2}}{ }^{\prime} \mathbf{P}_{3}{ }^{\prime}$,

$$
\left.\begin{array}{rl}
\Rightarrow \mathrm{P}_{3} \mathrm{P}_{2} \mathrm{P}_{1} \mathrm{AP}_{1}^{\prime} \mathrm{P}_{2}^{\prime} \mathrm{P}_{3}^{\prime}= & {\left[\begin{array}{rrr}
6 & 4 & 2 \\
0 & \frac{4}{3} & \frac{4}{3} \\
0 & 0 & 0
\end{array}\right]\left[\begin{array}{rrr}
1 & -\frac{2}{3} & -1 \\
0 & 1 & 1 \\
0 & 0 & 1
\end{array}\right]}
\end{array}\right]=\left[\begin{array}{lll}
6 & 0 & 0 \\
0 & \frac{4}{3} & 0 \\
& \mathrm{PA} & \\
0 & 0 & 0
\end{array}\right]
$$

In this example, the $\operatorname{rank}(A)=2$.

## Generalized inverse of a matrix (Searle, 1966)

A matrix $G$ is said to be a generalized inverse of matrix $A$ if $A G A=A$. Matrix $G$ is not unique. There is an infinite number of matrices G that satisfy the condition AGA $=\mathrm{A}$.

## Computing G (Searle, 1971)

a) Consider $\mathrm{D}=\mathrm{PAQ}$, where P and Q are products of elementary operators. The matrix D is

$$
\mathrm{D}=\left[\begin{array}{rr}
\mathrm{D}_{\mathrm{r}} & 0 \\
0 & 0
\end{array}\right]
$$

Define

$$
\mathrm{D}^{-}=\left[\begin{array}{cc}
\mathrm{D}_{\mathrm{r}}^{-1} & 0 \\
0 & 0
\end{array}\right]
$$

Then, a g-inverse of matrix A is $\mathrm{G}=\mathrm{QD}^{-} \mathrm{P}$, because $\mathrm{AGA}=\mathrm{A}$.
Proof:
Note that

$$
\mathrm{DD}^{-} \mathrm{D}=\mathrm{D} \quad \text { and } \quad \mathrm{D}^{-} \mathrm{DD}^{-} \quad=\mathrm{D}^{-}
$$

Thus,

$$
\begin{aligned}
\mathrm{AGA} & =\left(\mathrm{P}^{-1} \mathrm{DQ}^{-1}\right)\left(\mathrm{QD}^{-} \mathrm{P}\right)\left(\mathrm{P}^{-1} \mathrm{DQ}^{-1}\right) \\
& =\mathrm{P}^{-1} \mathrm{DID}^{-} \mathrm{IDQ}^{-1} \\
& =\mathrm{P}^{-1} \mathrm{DQ}^{-1} \\
& =\mathrm{A}
\end{aligned}
$$

Also,

$$
\begin{aligned}
\mathrm{GAG} & =\left(\mathrm{QD}^{-} \mathrm{P}\right)\left(\mathrm{P}^{-1} \mathrm{DQ}^{-1}\right)\left(\mathrm{QD}^{-} \mathrm{P}\right) \\
& =\mathrm{QD}^{-} \mathrm{IDID}^{-} \mathrm{P} \\
& =\mathrm{QD}^{-} \mathrm{P} \\
& =\mathrm{G}
\end{aligned}
$$

b) Consider a matrix A of rank $=r$. If A can be partitioned in such a way that its leading principal minor is nonsingular, i.e.,

$$
\mathrm{A}_{\mathrm{m} \times \mathrm{n}}=\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12}  \tag{2-15}\\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right]
$$

where $A_{11}$ is $r \times r$ and $r\left(A_{11}\right)=r$. Then, a $g$-inverse of $A$ is:

$$
\mathrm{G}=\left[\begin{array}{rr}
\mathrm{A}_{11}^{-1} & 0 \\
0 & 0
\end{array}\right]
$$

because $\mathrm{AGA}=\mathrm{A}$.
Proof:

$$
\begin{aligned}
\text { AGA } & =\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right]\left[\begin{array}{rr}
\mathrm{A}_{11}^{-1} & 0 \\
0 & 0
\end{array}\right]\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right] \\
& =\left[\begin{array}{rr}
\mathrm{I} & 0 \\
\mathrm{~A}_{21} \mathrm{~A}_{11}^{-1} & 0
\end{array}\right]\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{22}
\end{array}\right] \\
& =\left[\begin{array}{ll}
\mathrm{A}_{11} & \mathrm{~A}_{12} \\
\mathrm{~A}_{21} & \mathrm{~A}_{21} \mathrm{~A}_{11}^{-1} \mathrm{~A}_{12}
\end{array}\right]
\end{aligned}
$$

Note that $A$ can be factored as follows: first, partition $A=\left[\begin{array}{c}F \\ K F\end{array}\right]$ where $F_{r \times n}$ are $r$ independent rows and KF are $\mathrm{m}-\mathrm{r}$ linear combinations of the first r rows. If A has r independent rows, it also has r independent columns, where $\mathrm{r} \leq \mathrm{m} \leq \mathrm{n}$. Assuming the set of r independent columns are the first ones, $A$ can be further partitioned as follows: $A=\left[\begin{array}{cc}A_{11} & B \\ K A_{11} & K B\end{array}\right]$ where $A_{11}$ is an $r \times r$ matrix and $B$ is an $r \times(n-r)$ matrix, where the columns of $\left[\begin{array}{c}B \\ K B\end{array}\right]$ are linear combinations of the $r$ independent columns $\left[\begin{array}{c}\mathrm{A}_{11} \\ \mathrm{KA}_{11}\end{array}\right]$, i.e.,

$$
\begin{aligned}
& {\left[\begin{array}{c}
\mathrm{B} \\
\mathrm{~KB}
\end{array}\right]=\left[\begin{array}{r}
\mathrm{A}_{11} \\
\mathrm{KA}_{11} \mathrm{~L}
\end{array}\right] . } \\
\Rightarrow & \mathrm{A}=\left[\begin{array}{cc}
\mathrm{A}_{11} & \mathrm{~A}_{11} \mathrm{~L} \\
\mathrm{KA}_{11} & \mathrm{KA}_{11} \mathrm{~L}
\end{array}\right]
\end{aligned}
$$

$$
\Rightarrow \mathrm{AGA}=\left[\begin{array}{rr}
\mathrm{A}_{11} & \mathrm{~A}_{11} \mathrm{~L} \\
\mathrm{KA}_{11} & \mathrm{KA}_{11} \mathrm{~L}
\end{array}\right]\left[\begin{array}{rr}
\mathrm{A}_{11}^{-1} & 0 \\
0 & 0
\end{array}\right]\left[\begin{array}{rr}
\mathrm{A}_{11} & \mathrm{~A}_{11} \mathrm{~L} \\
\mathrm{KA}_{11} & \mathrm{KA}_{11} \mathrm{~L}
\end{array}\right]
$$

$$
\Rightarrow \mathrm{AGA}=\left[\begin{array}{rr}
\mathrm{I} & 0 \\
\mathrm{~K} & 0
\end{array}\right]\left[\begin{array}{rr}
\mathrm{A}_{11} & \mathrm{~A}_{11} \mathrm{~L} \\
\mathrm{KA}_{11} & \mathrm{KA}_{11} \mathrm{~L}
\end{array}\right]
$$

$$
\Rightarrow A G A=\left[\begin{array}{rr}
A_{11} & A_{11} L \\
K A_{11} & K A_{11} L
\end{array}\right]=A \equiv\left[\begin{array}{ll}
A_{11} & A_{12} \\
A_{21} & A_{22}
\end{array}\right]
$$

or, by substituting $A_{11} L$ for $A_{12}$ in $A_{21} A_{11}^{-1} A_{12}$ we get

$$
\begin{aligned}
\mathrm{A}_{21} \mathrm{~A}_{11}{ }^{-1} \mathrm{~A}_{12} & =\mathrm{KA}_{11} \mathrm{~A}_{11}{ }^{-1} \mathrm{~A}_{11} \mathrm{~L} \\
& =\mathrm{KA}_{11} \mathrm{~L} \\
& \equiv \mathrm{~A}_{22}
\end{aligned}
$$

Also, $\mathrm{GAG}=\mathrm{G}$. Thus,
$G A G=\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]\left[\begin{array}{rr}\mathrm{A}_{11} & \mathrm{~A}_{11} \mathrm{~L} \\ \mathrm{KA}_{11} & \mathrm{KA}_{11} \mathrm{~L}\end{array}\right]\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]$
$\mathrm{GAG}=\left[\begin{array}{cc}\mathrm{I} & \mathrm{L} \\ 0 & 0\end{array}\right]\left[\begin{array}{cc}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]$
$\mathrm{GAG}=\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]=\mathrm{G}$
or,
$\mathrm{GAG}=\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]\left[\begin{array}{ll}\mathrm{A}_{11} & \mathrm{~A}_{12} \\ \mathrm{~A}_{21} & \mathrm{~A}_{22}\end{array}\right]\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]$
$\mathrm{GAG}=\left[\begin{array}{cc}\mathrm{I} & \mathrm{A}_{11}^{-1} \mathrm{~A}_{12} \\ 0 & 0\end{array}\right]\left[\begin{array}{cc}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]$
$\mathrm{GAG}=\left[\begin{array}{rr}\mathrm{A}_{11}^{-1} & 0 \\ 0 & 0\end{array}\right]$
c) Symmetric matrices. A computational algorithm for a symmetric matrix $A_{m n}$ of rank $=r$ is:

1) Find any nonsingular principal minor of order r, e.g., $A_{i i}$.
2) Invert $A_{i i}$, i.e., obtain $A_{11}{ }^{-1}$.
3) Replace each element of $A_{i i}$ in $A$ by the corresponding element of $A_{11}{ }^{-1}$.
4) Substitute zeroes for all the other elements of A.
5) The resulting matrix is a g-inverse of $A$.

## Examples:

a) Method 1: $\mathrm{G}=\mathrm{QD}^{-} \mathrm{P}$

$$
\begin{aligned}
& \mathrm{A}_{3 \times 3}=\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right], \mathrm{P}=\left[\begin{array}{rrr}
1 & 0 & 0 \\
-\frac{2}{3} & 1 & 0 \\
-1 & 1 & 1
\end{array}\right], \mathrm{Q}=\mathrm{P}^{\prime} \\
& \mathrm{QD}^{-}=\left[\begin{array}{ccc}
1 & -\frac{2}{3} & -1 \\
0 & 1 & 1 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{ccc}
\frac{1}{6} & 0 & 0 \\
0 & \frac{3}{4} & 0 \\
0 & 0 & 0
\end{array}\right]=\left[\begin{array}{ccc}
\frac{1}{6} & -\frac{1}{2} & 0 \\
0 & \frac{3}{4} & 0 \\
0 & 0 & 0
\end{array}\right]
\end{aligned}
$$

$$
\mathrm{QD}^{-} \mathrm{P}=\left[\begin{array}{rrr}
\frac{1}{6} & -\frac{1}{2} & 0 \\
0 & \frac{3}{4} & 0 \\
0 & 0 & 0
\end{array}\right]\left[\begin{array}{rrr}
1 & 0 & 0 \\
-\frac{2}{3} & 1 & 0 \\
-1 & 1 & 1
\end{array}\right]=\left[\begin{array}{rrr}
\frac{1}{2} & -\frac{1}{2} & 0 \\
-\frac{1}{2} & \frac{3}{4} & 0 \\
0 & 0 & 0
\end{array}\right]
$$

Thus, $\mathrm{AGA}=\mathrm{A}$ and $\mathrm{GAG}=\mathrm{G}$.
b)Method 2: Principal minor.

Note that if $\mathrm{A}_{33}=\left|\begin{array}{ll}6 & 4 \\ 4 & 4\end{array}\right|$ is used, then

$$
\begin{aligned}
& \mathrm{G}=\left[\begin{array}{rr}
\mathrm{A}_{33}^{-1} & 0 \\
0 & 0
\end{array}\right]=\mathrm{QD}^{-} \mathrm{P} \text { above. Thus, } \\
& \mathrm{A}^{-}=\left[\begin{array}{lll}
{\left[\begin{array}{ll}
6 & 4 \\
4 & 4
\end{array}\right]} & 0 \\
0 & 0 & 0
\end{array}\right]=\left[\begin{array}{rr}
\frac{1}{8}\left[\begin{array}{rr}
4 & -4 \\
-4 & 6
\end{array}\right] & \begin{array}{l}
0 \\
0 \\
0
\end{array} \\
0 & 0
\end{array}\right] \\
& \mathrm{A}^{-}=\left[\begin{array}{rrr}
\frac{1}{2} & -\frac{1}{2} & 0 \\
-\frac{1}{2} & \frac{3}{4} & 0 \\
0 & 0 & 0
\end{array}\right]=\mathrm{QD}^{-} \mathrm{P}
\end{aligned}
$$

The easiest to obtain $G$ is the one based on $A_{11}$, where $A_{11}=\left|\begin{array}{ll}4 & 0 \\ 0 & 2\end{array}\right|$. Here,

$$
\left.\begin{array}{rl}
\mathrm{G} & =\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & \frac{1}{4} & 0 \\
0 & 0 & \frac{1}{2}
\end{array}\right] \\
\mathrm{AG} & =\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right]\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & \frac{1}{4} & 0 \\
0 & 0 & \frac{1}{2}
\end{array}\right]=\left[\begin{array}{lll}
0 & 1 & 1 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right] \\
& =\left[\begin{array}{lll}
0 & 1 & 1 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right]=\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right]=\mathrm{A} \\
\mathrm{GA} & =\left[\begin{array}{lll}
0 & 0 & \frac{1}{2}
\end{array}\right] \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]=\left[\begin{array}{lll}
6 & 4 & 2 \\
4 & 4 & 0 \\
2 & 0 & 2
\end{array}\right]=\left[\begin{array}{lll}
0 & 0 & 0 \\
1 & 1 & 0 \\
1 & 0 & 1
\end{array}\right]=\left[\begin{array}{ll}
0
\end{array}\right]
$$

$$
\text { GAG }=\left[\begin{array}{ccc}
0 & 0 & 0  \tag{2-20}\\
1 & 1 & 0 \\
1 & 0 & 1
\end{array}\right]\left[\begin{array}{ccc}
0 & 0 & 0 \\
0 & \frac{1}{4} & 0 \\
0 & 0 & \frac{1}{2}
\end{array}\right]=\left[\begin{array}{ccc}
0 & 0 & 0 \\
0 & \frac{1}{4} & 0 \\
0 & 0 & \frac{1}{2}
\end{array}\right]=\mathrm{G}
$$

Thus, $\mathrm{AGA}=\mathrm{A}$ and $\mathrm{GAG}=\mathrm{G}$ also.

Generalized inverses for partitioned matrices (Searle, 1971, pp 16-28)
Substitute -'s for -1's in the superscripts of formulas [15] and [18] for partitioned matrices that have a unique inverse. Thus,
from equation [15],

$$
\left[\begin{array}{ll}
\mathrm{A}^{11} & \mathrm{~A}^{12} \\
\mathrm{~A}^{21} & \mathrm{~A}^{22}
\end{array}\right]=\left[\begin{array}{cc}
\left(\mathrm{A}_{11}-\mathrm{A}_{12} \mathrm{~A}_{22}^{-} \mathrm{A}_{21}\right)^{-} & -\mathrm{A}^{11} \mathrm{~A}_{12} \mathrm{~A}_{22}^{-} \\
-\mathrm{A}_{22}^{-} \mathrm{A}_{21} \mathrm{~A}^{11} & \mathrm{~A}_{22}-\mathrm{A}^{21} \mathrm{~A}_{12} \mathrm{~A}_{22}^{-}
\end{array}\right]
$$

and from equation [18],

$$
\left[\begin{array}{ll}
A^{11} & A^{12} \\
A^{21} & A^{22}
\end{array}\right]=\left[\begin{array}{cc}
\mathrm{A}_{11}^{-}-A^{12} \mathrm{~A}_{21} \mathrm{~A}_{11}^{-} & -\mathrm{A}_{11}^{-} \mathrm{A}_{12} \mathrm{~A}^{22} \\
-\mathrm{A}^{22} \mathrm{~A}_{21} \mathrm{~A}_{11}^{-} & \left(\mathrm{A}_{22}-\mathrm{A}_{21} \mathrm{~A}_{11}^{-} \mathrm{A}_{12}\right)^{-}
\end{array}\right] .
$$

## Linear Equations

Consistency: a set of linear equations $\mathrm{Ax}=\mathrm{y}$ is consistent if, and only if, the linear relationships that exist among rows of the matrix A also exist among the elements of vector y .

## Theorems:

1) The equations $A x=y$ are consistent if, and only if, the rank of the augmented matrix [A y] is
equal to the rank of A .
Proof:
$\Rightarrow$ If $A x=y$ is consistent, then $[A y]=\left[\begin{array}{rr}A_{1} & y_{1} \\ L A_{1} & L y_{1}\end{array}\right] \Rightarrow$ the same number of linearly
independent rows exists for $A$ and $[A y] \Rightarrow \operatorname{rank}(A)=\operatorname{rank}([A y])$.
$\Leftarrow \operatorname{If} \operatorname{rank}(A)=\operatorname{rank}([A y])$, then $\operatorname{rank}\left[\begin{array}{c}\mathrm{A}_{1} \\ \mathrm{LA}_{1}\end{array}\right]=\operatorname{rank}\left[\begin{array}{cc}\mathrm{A}_{1} & \mathrm{y}_{1} \\ \mathrm{LA}_{1} & \mathrm{Ly}_{1}\end{array}\right]$ for some K .
Clearly this is true only if $K=L$, which implies that $A x=y$ is a consistent set of equations.
2) If a matrix $A$ has $p$ rows and rank $r, p>r$, and if $D=P A Q$ is an equivalent diagonal form of
$A$, then the equations $A x=y$ are consistent if, and only if, the last p-r elements of Py are zero.
Proof:
$\Rightarrow$ Given: $\mathrm{Ax}=\mathrm{y}$ consistent.

$$
\mathrm{D}=\mathrm{PAQ}
$$

Show: last p-r elements of $\mathrm{Py}=0$.

$$
\begin{aligned}
& A x=y \\
& \text { PAx }=P y
\end{aligned}
$$

But

$$
\text { PAx }=\left[\begin{array}{c}
A_{r} \mathrm{x} \\
0
\end{array}\right]=\text { Py } \Rightarrow \text { last } p-r \text { elements of Py }=0
$$

$\Leftarrow$ Given: last p-r elements of $\mathrm{Py}=0$.
Show: $\mathrm{Ax}=\mathrm{y}$ is consistent.
If $\mathrm{Py}=0$ for the last $\mathrm{p}-\mathrm{r}$ elements, then the set of equations

$$
\left[\begin{array}{c}
\mathrm{A}_{\mathrm{r}} \\
0
\end{array}\right] \mathrm{x}=\mathrm{Py}
$$

is consistent. Because P is a matrix of elementary operators $\mathrm{P}^{-1}$ exists, so
$P^{-1}\left[\begin{array}{l}A_{r} \\ 0\end{array}\right] x=A x=P^{-1} P y=y=A x=y$ is also a set of consistent equations. This is so
because:
a) $\left[\begin{array}{l}A_{r} \\ 0\end{array}\right] x=$ Py is a set of consistent equations, and
b) the same set of linear relationships (i.e., $P^{-1}$ ) were applied to the rows of $\left[\begin{array}{l}A_{r} \\ 0\end{array}\right] x$ and to the elements of Py.
3) A solution to the consistent set of equations $A x=y$ is given by $x=$ Gy if, and only if, AGA =
A.

Proof:
$\Rightarrow$ Given $\mathrm{x}=\mathrm{Gy}$, show that $\mathrm{AGA}=\mathrm{A}$.

$$
x=\mathrm{Gy} \Rightarrow \mathrm{Ax}=\mathrm{AGy}
$$

But $y=A x$,
$\Rightarrow \quad \mathrm{Ax}=\mathrm{AGAx}$
$\Rightarrow \quad \mathrm{A}=\mathrm{AGA}$
$\Leftarrow$ Given $\mathrm{AGA}=\mathrm{A}$, show that $\mathrm{x}=\mathrm{Gy}$.

$$
\mathrm{AGAx}=\mathrm{Ax}
$$

But

$$
\mathrm{Ax}=\mathrm{y}
$$

$\Rightarrow \mathrm{AGy}=\mathrm{y}$
or

$$
A(G y)=y \Rightarrow x=G y \text { is a solution of the system of equations } A x=y
$$

Note: If $A$ is square and full rank $x$ is the vector of solutions to $A x=y$.
4) Let A be a matrix of n columns, z be any $\mathrm{n} \times 1$ vector and define $\mathrm{H} \equiv \mathrm{GA}$. Then, if $\mathrm{A}=\mathrm{AGA}$,
$x^{\circ}$ is a solution to the consistent set of equations $A x=y$, where

$$
x^{\circ}=G y+(H-I) z
$$

Proof:

$$
\begin{aligned}
\mathrm{x}^{\circ} & =\mathrm{Gy}+(\mathrm{H}-\mathrm{I}) \mathrm{z} \\
A x^{\circ} & =\mathrm{AGy}+\mathrm{A}(\mathrm{GA}-\mathrm{I}) \mathrm{z} \\
A x^{\circ} & =\mathrm{AGy}+(\mathrm{AGA}-\mathrm{A}) \mathrm{z}
\end{aligned}
$$

But,

$$
\begin{aligned}
\mathrm{AGA} & =\mathrm{A} \\
\Rightarrow \mathrm{Ax}^{\circ} & =\mathrm{AGy} \\
\Rightarrow \mathrm{Ax}^{\circ} & =\mathrm{y}, \text { by theorem } 3 \text { ) above. }
\end{aligned}
$$

5) Given a set of consistent equations $A x=y$ and a matrix $G$ such that $A G A=A$, define $H \equiv$ GA. Then, a linear combination of the elements of any solution $x^{\circ}$, e.g., $k^{\prime} x^{\circ}$, is unique if, and only $\mathrm{if}, \mathrm{k}^{\prime} \mathrm{H}=\mathrm{k}^{\prime}$.

Proof: from theorem 4), $x^{\circ}=\mathrm{Gy}+(\mathrm{H}-\mathrm{I}) \mathrm{z}$. Thus,

$$
\mathrm{k}^{\prime} \mathrm{x}^{\circ}=\mathrm{k}^{\prime} \mathrm{Gy}+\mathrm{k}^{\prime}(\mathrm{H}-\mathrm{I}) \mathrm{z}
$$

which is independent of the arbitrary vector z if $\mathrm{k}^{\prime} \mathrm{H}=\mathrm{k}^{\prime}$. If so, the value of $\mathrm{k}^{\prime} \mathrm{x}^{\circ}$ is $\mathrm{k}^{\prime} \mathrm{Gy}$ for any $x^{\circ}$. To see that this statement is true, consider any two solution vectors, i.e., $x_{i}$ and $x_{j}$, thus

$$
\begin{align*}
x_{i} & =G_{i} y  \tag{2-24}\\
\Rightarrow x_{i} & =G_{i} A x, \text { because } y=A x .
\end{align*}
$$

Similarly,

$$
\mathrm{x}_{\mathrm{j}}=\mathrm{G}_{\mathrm{j}} \mathrm{Ax}
$$

But

$$
\begin{aligned}
& \mathrm{Ax}_{\mathrm{i}}=\mathrm{AG}_{\mathrm{i}} \mathrm{Ax}=\mathrm{Ax}=\mathrm{y} \\
& \mathrm{Ax}_{\mathrm{j}}=\mathrm{AG}_{\mathrm{j}} \mathrm{Ax}=\mathrm{Ax}=\mathrm{y} \\
& \Rightarrow \quad \mathrm{~m}^{\prime} \mathrm{Ax}_{\mathrm{i}}=\mathrm{m}^{\prime} \mathrm{Ax} \quad=\mathrm{m}^{\prime} \mathrm{y} \\
& m^{\prime} A x_{j}=m^{\prime} A x=m^{\prime} y
\end{aligned}
$$

for some vector $m$. Thus, letting $k^{\prime}=m^{\prime} A$, we have that

$$
\mathrm{k}^{\prime} \mathrm{x}_{\mathrm{i}}=\mathrm{k}^{\prime} \mathrm{x}_{\mathrm{j}}=\mathrm{k}^{\prime} \mathrm{x}=\mathrm{m}^{\prime} \mathrm{y}
$$

$\Rightarrow$ no matter which matrix $G$ we use to obtain a solution vector $x^{\circ}$, a linear combination of the elements of $x^{\circ}$ satisfying the relationship $\mathrm{k}^{\prime} \mathrm{H}=\mathrm{k}^{\prime}$ is unique.

Also, note that

$$
\mathrm{k}^{\prime} \mathrm{H}=\mathrm{m}^{\prime} \mathrm{AGA}=\mathrm{m}^{\prime} \mathrm{A}
$$

$\Rightarrow$ a necessary and sufficient condition for $\mathrm{k}^{\prime} \mathrm{x}^{\circ}$ to be unique is for $\mathrm{k}^{\prime}$ to be a linear combination of the rows of A .
