## ANIMAL BREEDING NOTES

## CHAPTER 19

## DIRECT AND MATERNAL GENETIC EFFECTS MODELS

Some traits are affected not only by an animals' ability to perform, but also by the environment provided by its dam. Examples of these traits are birth weight (BW), weaning weight (WW), and first calf calving ease (CE1). Thus, models used to obtain predictions of genetic values for these traits must account for both direct genetic effects (i.e., an animal's own ability to perform), and for maternal effects. Maternal effects are genetic to the dam and environmental to her progeny.

Direct and maternal animal models
If parents and nonparents have several records each, a direct and maternal genetic effects model (DMM) can be constructed by putting together two simple repeatability models (SRM), one for direct genetic effects and another one for maternal effects (DMM1):

$$
\begin{aligned}
\mathrm{y} & =\mathrm{Xb}+\mathrm{Z}_{\mathrm{id}} \mathrm{u}_{\mathrm{id}}+\mathrm{Z}_{\mathrm{im}} \mathrm{u}_{\mathrm{im}}+\mathrm{Z}_{\mathrm{ip}} \mathrm{p}_{\mathrm{id}}+\mathrm{Z}_{\mathrm{dp}} \mathrm{p}_{\mathrm{dm}}+\left(\mathrm{e}_{\mathrm{id}}+\mathrm{e}_{\mathrm{dm}}\right) \\
\mathrm{E}[\mathrm{y}] & =\mathrm{Xb}
\end{aligned}
$$

$$
=\left[\begin{array}{rr|rr|r}
\mathrm{Ag}_{11} & \mathrm{Ag}_{12} \mid & 0 & 0 & \mid \\
\mathrm{Ag}_{21} & \mathrm{Ag}_{22} & \mid & 0 & 0 \\
--- & --- & --- & --- & 0 \\
0 & 0 & \mathrm{I} \gamma_{1} & 0 & 0 \\
0 & 0 & 0 & \mathrm{I} \gamma_{2} & 0 \\
0 & -- & --- & --- & -- \\
-- & -- & \mid & 0 & 0
\end{array}\right] \sigma_{\mathrm{e}}^{2}
$$

where

$$
\begin{aligned}
& \mathrm{g}_{11}=\frac{\sigma_{\mathrm{dd}}}{\left(\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}\right)} \\
& \mathrm{g}_{12}=\frac{\sigma_{\mathrm{dm}}}{\left(\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}\right)}=\mathrm{g}_{21} \\
& \mathrm{~g}_{22}=\frac{\sigma_{\mathrm{mm}}}{\left(\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}\right)} \\
& \gamma_{1}=\frac{\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2}}{\left(\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}\right)} \\
& \gamma_{2}=\frac{\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}}{\left(\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}\right)} \\
& \sigma_{\mathrm{e}}^{2}=\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}
\end{aligned}
$$

and
$\sigma_{\mathrm{dd}}=$ additive direct genetic variance,
$\sigma_{\mathrm{dm}}=$ additive genetic covariance between direct and maternal effects, and
$\sigma_{\mathrm{mm}}=$ additive maternal genetic variance.
where the meaning of subscripts is:
id $=$ animal direct genetic effects, $i m=$ animal maternal genetic effects, $\mathrm{dm}=$ dam maternal genetic effects, ip $=$ animal permanent environmental effects, and $\mathrm{dp}=$ dam permanent environmental effects.

Vectors are defined as:
$\mathrm{y}=$ vector of records,
$\mathrm{b}=$ vector of unknown fixed effects,
$u=$ vector of unknown random additive genetic effects,
$\mathrm{p}=$ vector of unknown random permanent environment effects,
$\mathrm{e}=$ vector of unknown residual effects.
Matrices X and Z are incidence matrices relating records to fixed and to random effects, respectively.

Matrices $\mathrm{Z}_{\mathrm{id}}$ and $\mathrm{Z}_{\mathrm{im}}$ contain columns of zeroes for animals without records.
The same, i.e., all, animals are represented in vectors $u_{i d}$ and $u_{i m}$, but only those with records are included in $\mathrm{p}_{\mathrm{id}}$ and $\mathrm{p}_{\mathrm{dm}}$.

Matrix A is the matrix of additive genetic relationships (i.e., the numerator relationship matrix).

The MME for the DMM1 are:

| X ${ }^{\prime} \mathrm{X}$ | $\mathrm{X}^{\prime} \mathrm{Z}_{\text {id }}$ | $\mathrm{X}^{\prime} \mathrm{Z}_{\text {im }}$ | $X^{\prime} Z_{\text {ip }}$ | $\mathrm{X}^{\prime} \mathrm{Z}_{\mathrm{dp}}$ | b |  | $X^{\prime} \mathrm{y}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Z}_{\mathrm{id}}{ }^{\prime} \mathrm{X}$ | $Z_{\text {id }}{ }^{\prime} Z_{\text {id }}+A^{-1} \mathrm{~g}^{11}$ | $\mathrm{Z}_{\text {id }}{ }^{\prime} \mathrm{Z}_{\text {im }}+\mathrm{A}^{-1} \mathrm{~g}^{12}$ | $\mathrm{Z}_{\text {id }}{ }^{\prime} \mathrm{Z}_{\text {ip }}$ | $\mathrm{Zid}^{\prime}{ }^{\prime} \mathrm{Z}_{\mathrm{dp}}$ | $\mathrm{u}_{\text {id }}$ |  | $\mathrm{Zid}_{\text {d }}{ }^{\prime} \mathrm{y}$ |
| $\mathrm{Z}_{\text {im }}{ }^{\prime} \mathrm{X}$ | $Z_{\text {im }}{ }^{\prime} Z_{\text {id }}+A^{-1} \mathrm{~g}^{12}$ | $\mathrm{Z}_{\text {im }}{ }^{\prime} \mathrm{Z}_{\text {im }}+\mathrm{A}^{-1} \mathrm{~g}^{22}$ | $Z_{\text {im }}{ }^{\prime} Z_{\text {ip }}$ | $Z_{\text {im }}{ }^{\prime} Z_{\text {dp }}$ | $\mathrm{u}_{\mathrm{im}}$ |  | $Z_{\text {im }}{ }^{\prime} \mathrm{y}$ |
| $\mathrm{Z}_{\mathrm{ip}}{ }^{\prime} \mathrm{X}$ | $\mathrm{Z}_{\mathrm{ip}}{ }^{\prime} \mathrm{Z}_{\text {id }}$ | $\mathrm{Z}_{\text {ip }}{ }^{\prime} \mathrm{Z}_{\text {im }}$ | $\mathrm{Z}_{\text {ip }}{ }^{\prime} \mathrm{Z}_{\text {ip }}+\mathrm{I} \gamma_{1}{ }^{-1}$ | $\mathrm{Zip}^{\prime}{ }^{\prime} \mathrm{Z}_{\mathrm{dp}}$ | $\mathrm{p}_{\text {id }}$ |  | $\mathrm{Z}_{\text {ip }}$, y |
| $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{X}$ | $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{Z}_{\text {id }}$ | $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{Z}_{\text {im }}$ | $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{Z}_{\text {ip }}$ | $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{Z}_{\mathrm{dp}}+\mathrm{I} \gamma_{2}^{-1}{ }^{\text {d }}$ | $\mathrm{p}_{\mathrm{dm}}$ |  | $\mathrm{Z}_{\mathrm{dp}}{ }^{\prime} \mathrm{y}$ ] |

## Remarks:

$$
\begin{aligned}
& \mathrm{Z}_{\mathrm{id}}=\left[\begin{array}{ll}
0 & \mathrm{Z}_{\mathrm{ip}}
\end{array}\right] \\
& \mathrm{Z}_{\mathrm{im}}=\left[\begin{array}{lll}
0 & \mathrm{Z}_{\mathrm{dm}} & 0
\end{array}\right]
\end{aligned}
$$

parents nonparents
without
records

In many instances, animals (can) have only a single observation per trait, e.g., BW, WW. In such cases, $\mathbf{Z}_{\mathrm{ip}}=\mathbf{I}$, and because $\mathrm{p}_{\mathrm{id}}$ is uncorrelated to the other random effects in the DMM1, it can be placed in the residual term. Thus, the DMM1 becomes DMM2:

$$
\begin{aligned}
& y=X b+Z_{i d} u_{i d}+Z_{i m} u_{i m}+Z_{d p} p_{d m}+\left(p_{i d}+e_{i d}+e_{d m}\right) \\
& \mathrm{E}[\mathrm{y}]=\mathrm{Xb}
\end{aligned}
$$

where

$$
\begin{aligned}
& \sigma_{\mathrm{e}}^{2}=\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2} \\
& \mathrm{~g}_{11}=\frac{\sigma_{\mathrm{dd}}}{\sigma_{\mathrm{e}}^{2}} \\
& \mathrm{~g}_{12}=\frac{\sigma_{\mathrm{dm}}}{\sigma_{\mathrm{e}}^{2}}=\mathrm{g}_{21} \\
& \mathrm{~g}_{22}=\frac{\sigma_{\mathrm{mm}}}{\sigma_{\mathrm{e}}^{2}} \\
& \gamma=\frac{\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}}{\sigma_{\mathrm{e}}^{2}}
\end{aligned}
$$

The MIME for the DMM2 are:

Remark: $\left\{\mathrm{g}_{\mathrm{ij}}\right\}$ from $\mathbf{D M M} 2 \neq\left\{\mathrm{g}_{\mathrm{ij}}\right\}$ from DMM1 and $\gamma$ from DMM2 $\neq \gamma_{2}$ from DMM1 because

$$
\sigma_{e}^{2}= \begin{cases}\sigma_{e_{d}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2} & \text { for DMM1 } \\ \sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2} & \text { for DMM2 }\end{cases}
$$

Direct and maternal reduced animal models
The RAM corresponding to the DMM2, i.e., the DM2RAM, is:
$\left[\begin{array}{l}y_{p} \\ y_{n}\end{array}\right]=\left[\begin{array}{l}X_{p} \\ X_{n}\end{array}\right] b+\left[\begin{array}{r}Z_{p d} \\ 1 / 2 P_{n p, d}\end{array}\right] u_{p d}+\left[\begin{array}{l}Z_{p m} \\ Z_{n m}\end{array}\right] u_{p m}+\left[\begin{array}{l}Z_{p d p} \\ Z_{n d p}\end{array}\right] p_{d m}+\left[\begin{array}{r}p_{p d}+e_{p d}+e_{p m} \\ \phi_{n d}+p_{n d}+e_{n d}+e_{n m}\end{array}\right]$
$E\left[\begin{array}{l}y_{p} \\ y_{n}\end{array}\right]=\left[\begin{array}{l}X_{p} \\ X_{n}\end{array}\right] b$

where

$$
\begin{aligned}
& \sigma_{\mathrm{e}}^{2}=\sigma_{\mathrm{E}_{\mathrm{pd}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2} \\
& \mathrm{~g}_{11}=\frac{\sigma_{\mathrm{dd}}}{\sigma_{\mathrm{e}}^{2}} \\
& \mathrm{~g}_{12}=\frac{\sigma_{\mathrm{dm}}}{\sigma_{\mathrm{e}}^{2}}=\mathrm{g}_{21} \\
& \mathrm{~g}_{22}=\frac{\sigma_{\mathrm{mm}}}{\sigma_{\mathrm{e}}^{2}} \\
& \gamma=\frac{\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}}{\sigma_{\mathrm{e}}^{2}}
\end{aligned}
$$

$\mathrm{A}_{\mathrm{pp}}=$ numerator relationship matrix among parents
$\mathrm{D}_{\mathrm{n}}=\operatorname{diag}\left\{\mathrm{d}_{\mathrm{ii}}\right\}$
$D_{\mathrm{n}}=\operatorname{diag}\left\{1-\delta_{\mathrm{si}_{\mathrm{i}}}\left(1 / 4 \mathrm{a}_{\mathrm{sisi}}\right)-\delta_{\mathrm{di}}\left(1 / 4 \mathrm{a}_{\mathrm{di}_{\mathrm{d}}}\right)\right\}$
where

$$
\begin{aligned}
& \begin{array}{l}
\delta_{\mathrm{s}_{\mathrm{i}}}=\left\{\begin{array}{lr}
1 \text { if } \mathrm{sic}_{\mathrm{i}} \text { is known } \\
0 & \text { else }
\end{array}\right. \\
\delta_{\mathrm{d}_{\mathrm{i}}}= \begin{cases}1 \text { if } \mathrm{d}_{\mathrm{i}} \text { is known } \\
0 & \text { else }\end{cases}
\end{array} \\
& \mathrm{y}_{\mathrm{p}} \quad=\text { vector of records of parents } \\
& \mathrm{y}_{\mathrm{n}} \quad=\quad \text { vector of records of nonparents } \\
& \text { b } \quad=\text { vector of unknown fixed effects } \\
& \mathrm{u}_{\mathrm{pd}} \quad=\text { vector of unknown random additive direct genetic effects of parents } \\
& \mathrm{u}_{\mathrm{pm}}=\text { vector of unknown random additive maternal genetic effects of parents } \\
& \mathrm{p}_{\mathrm{dm}}=\text { vector of unknown random maternal dam permanent environment effects } \\
& \mathrm{p}_{\mathrm{pd}}=\text { vector of unknown random direct parent permanent environment effects } \\
& p_{\text {nd }}=\text { vector of unknown random direct nonparent permanent environment effects } \\
& \varphi_{\mathrm{nd}} \quad=\quad \text { vector of Mendelian sampling of nonparent direct additive genetic effects } \\
& \text { where }
\end{aligned}
$$

$\mathrm{e}_{\mathrm{pd}} \quad=$ vector of unknown random direct (maternal) residual effects of parents
$\mathrm{e}_{\mathrm{nd}} \quad=$ vector of unknown random direct residual effects of nonparents
$\mathrm{e}_{\mathrm{nm}}=$ vector of unknown random maternal residual effects of nonparents
$\mathrm{X}_{\mathrm{p}} \quad=$ incidence matrix relating parent records to b
$\mathrm{X}_{\mathrm{n}} \quad=$ incidence matrix relating nonparent records to b
$\mathrm{Z}_{\mathrm{pd}} \quad=$ incidence matrix relating parent records to $\mathrm{u}_{\mathrm{pd}}$
$P_{\text {np,d }}=$ incidence matrix relating nonparent records to $u_{p d}$
$Z_{\mathrm{pm}}=$ incidence matrix relating parent records to $\mathrm{u}_{\mathrm{pm}}$,
$\mathrm{Z}_{\mathrm{nm}} \quad=$ incidence matrix relating nonparent records to $\mathrm{u}_{\mathrm{pm}}$
$\mathrm{Z}_{\mathrm{pdp}}=$ incidence matrix relating parent records to $\mathrm{p}_{\mathrm{dm}}$
$\mathrm{Z}_{\text {ndp }}=$ incidence matrix relating nonparent records to $\mathrm{p}_{\mathrm{dm}}$

## Remarks:

(i) The $\mathrm{i}^{\text {th }}$ row of the $\mathrm{Z}_{\text {pd }}$ has a 1 in the $\mathrm{j}^{\text {th }}$ column corresponding the $\mathrm{j}^{\text {th }}$ parent with a record.
(ii) The $i^{\text {th }}$ row of $\mathrm{P}_{\mathrm{np}, \mathrm{d}}$ has a 1 in the $\mathrm{s}_{\mathrm{i}}^{\text {th }}$ column, for the sire of nonparent i , if $\mathrm{s}_{\mathrm{i}}$ is known, and another 1 in the $d_{i}^{\text {th }}$ column, for the dam of nonparent i , if $\mathrm{d}_{\mathrm{i}}$ is known.
(iii) The $\mathrm{i}^{\text {th }}$ rows of $\mathrm{Z}_{\mathrm{pm}}, \mathrm{Z}_{\mathrm{nm}}, \mathrm{Z}_{\mathrm{pdp}}$ and $\mathrm{Z}_{\mathrm{ndp}}$ have a 1 in the column corresponding to the dam of the $\mathrm{i}^{\text {th }}$ individual.

The MME for the DM2RAM are:

$$
\begin{aligned}
& {\left[\left.\begin{array}{rrr}
X_{p}{ }^{\prime} X_{p}+X_{n}{ }^{\prime} R_{n}^{-1} X_{n} & X_{p}{ }^{\prime} Z_{p d}+X_{n}{ }^{\prime} R_{n}^{-1} P_{n p, d}(1 / 2) & \mid \\
Z_{p d}{ }^{\prime} X_{p}+(1 / 2) P_{n p, d}{ }^{\prime} R_{n}^{-1} X_{n} & \mid & Z_{p d}{ }^{\prime} Z_{p d}+(1 / 2) P_{n p}{ }^{\prime} R_{n}^{-1} P_{n p, d}(1 / 2)+A_{p p}^{-1} g^{11}
\end{array} \right\rvert\,\right.} \\
& \mathrm{X}_{\mathrm{p}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+\mathrm{X}_{\mathrm{n}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}{ }^{-1} \mathrm{P}_{\mathrm{nd}} \quad \mid \quad \mathrm{X}_{\mathrm{p}}{ }^{\prime} \mathrm{Z}_{\mathrm{pdp}}+\mathrm{X}_{\mathrm{n}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}{ }^{-1} \mathrm{Z}_{\mathrm{ndp}} \\
& \mathrm{Z}_{\mathrm{pd}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+(1 / 2) \mathrm{P}_{\mathrm{np}, \mathrm{~d}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{nm}}+\mathrm{A}_{\mathrm{pp}}^{-1} * \mathrm{~g}^{12} \mid \quad \mathrm{Z}_{\mathrm{pd}}{ }^{\prime} Z_{\mathrm{pdp}}+(1 / 2) \mathrm{P}_{\mathrm{np}, \mathrm{~d}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{ndp}} \\
& \mathrm{Z}_{\mathrm{pm}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+\mathrm{Z}_{\mathrm{nm}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{nm}}+\mathrm{A}_{\mathrm{pp}}^{-1} * \mathrm{~g}^{22} \mid \quad \mathrm{Z}_{\mathrm{pm}}{ }^{\prime} \mathrm{Z}_{\mathrm{pdp}}+\mathrm{Z}_{\mathrm{nm}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{ndp}} \\
& \left.Z_{\mathrm{pdp}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}{ }^{1} \mathrm{P}_{\mathrm{nd}} \mid \quad \mathrm{Z}_{\mathrm{pdp}}{ }^{\prime} \mathrm{Z}_{\mathrm{pdp}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{ndp}}+\mathrm{I}_{\gamma^{-}}{ }^{1}\right]
\end{aligned}
$$

$$
\left[\begin{array}{c}
\mathrm{b} \\
\mathrm{u}_{\mathrm{pd}} \\
\mathrm{u}_{\mathrm{pm}} \\
\mathrm{p}_{\mathrm{dm}}
\end{array}\right]=\left[\begin{array}{r}
\mathrm{X}_{\mathrm{p}}^{\prime} \mathrm{y}_{\mathrm{p}}+\mathrm{X}_{\mathrm{n}}^{\prime}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{y}_{\mathrm{n}} \\
\mathrm{Z}_{\mathrm{pd}}^{\prime} \mathrm{y}_{\mathrm{p}}+(1 / 2) \mathrm{P}_{\mathrm{np}, \mathrm{~d}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{y}_{\mathrm{n}} \\
\mathrm{Z}_{\mathrm{pm}}^{\prime} \mathrm{y}_{\mathrm{p}}+\mathrm{Z}_{\mathrm{nm}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{y}_{\mathrm{n}} \\
\mathrm{Z}_{\mathrm{pdp}}, \mathrm{y}_{\mathrm{p}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{y}_{\mathrm{n}}
\end{array}\right]
$$

where

$$
\mathrm{R}_{\mathrm{n}}{ }^{-1}=\left(\mathrm{D}_{\mathrm{nd}} \mathrm{~g}_{11}+\mathrm{I}\right)^{-1}
$$

## Backsolutions for nonparents in the DM2RAM

(i) Additive direct genetic effects

$$
\begin{aligned}
& {\left[\begin{array}{c}
\hat{\mathrm{u}} \\
--- \\
\hat{\mathrm{e}}
\end{array}\right]=\left[\begin{array}{c}
\hat{\mathrm{u}}_{\mathrm{pd}} \\
\hat{\mathrm{u}}_{\mathrm{pm}} \\
\hat{\mathrm{p}}_{\mathrm{dm}} \\
--- \\
\hat{\mathrm{e}}_{\mathrm{p}} \\
\hat{\varepsilon}_{\mathrm{n}}
\end{array}\right]} \\
& \hat{u}_{n_{d}}=C_{u_{d}} G^{-1} \hat{u}+C_{e_{d}} R^{-1} \hat{e} \\
& \mathrm{C}_{\mathrm{ud}_{\mathrm{d}}}=\operatorname{cov}\left(\mathrm{u}_{\mathrm{nd}},\left[\mathrm{u}_{\mathrm{pd}}, \quad \vdots \mathrm{u}_{\mathrm{pm}}, \quad \vdots \mathrm{p}_{\mathrm{dm}}{ }^{\prime}\right]\right) \\
& =\operatorname{cov}\left(1 / 2 P_{\mathrm{np}, \mathrm{~d}} \mathrm{u}_{\mathrm{pd}}+\phi_{\mathrm{nd}},\left[\mathrm{u}_{\mathrm{pd}}{ }^{\prime} \vdots_{\mathrm{u}_{\mathrm{pm}}}{ }^{\prime} \mathrm{p}_{\mathrm{dm}},\right]\right) \\
& =\left[1 / 2 \mathrm{P}_{\mathrm{np}, \mathrm{~d}} \mathrm{~A}_{\mathrm{pp}} \mathrm{~g}_{11} \vdots 1 / 2 \mathrm{P}_{\mathrm{np}, \mathrm{~d}} \mathrm{~A}_{\mathrm{pp}} \mathrm{~g}_{12} \vdots 0\right] \sigma_{\mathrm{e}}^{2}
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{G}^{-1}=\left[\begin{array}{ll|r}
\mathrm{A}_{p p}^{-1} \mathrm{~g}^{11} & \mathrm{~A}_{\mathrm{pp}}^{-1} \mathrm{~g}^{12} & 0 \\
\mathrm{~A}_{\mathrm{pp}}^{-1} \mathrm{~g}^{12} & \mathrm{~A}_{\mathrm{pp}}^{-1} \mathrm{~g}^{22} & 0 \\
----- & ----- & --- \\
0 & 0 & \mathrm{I} \gamma^{-1}
\end{array}\right] \sigma_{e}^{-2} \\
& \Rightarrow \mathrm{C}_{\mathrm{u}_{\mathrm{d}}} \mathrm{G}^{-1} \hat{\mathrm{u}}=\mathrm{P}_{\mathrm{np}, \mathrm{~d}}\left(1 / 2 \hat{\mathrm{u}}_{\mathrm{pd}}\right) \\
& \mathrm{C}_{\mathrm{e}_{\mathrm{d}}}=\operatorname{cov}\left(\mathrm{u}_{\mathrm{nd}},\left[\mathrm{e}_{\mathrm{p}}{ }^{\prime} \vdots_{\varepsilon_{\mathrm{n}}},\right]\right) \\
& =\operatorname{cov}\left(1 / 2 \mathrm{P}_{\mathrm{np}, \mathrm{~d}} \mathbf{u}_{\mathrm{pd}}+\phi_{\mathrm{nd}},\left[\mathrm{e}_{\mathrm{p}}{ }^{\prime}: \phi_{\mathrm{nd}}{ }^{\prime}+\mathrm{p}_{\mathrm{nd}}{ }^{\prime}+\mathrm{e}_{\mathrm{nd}}{ }^{\prime}+\mathrm{e}_{\mathrm{nm}},\right]\right) \\
& =\left[0 \vdots D_{n d} g_{11}\right] \sigma_{e}^{2} \\
& R^{-1}=\left[\begin{array}{rrr}
I & \mid & 0 \\
-- & \mid & -\cdots------- \\
0 & \mid & \left(I+D_{n d} g_{11}\right)^{-1}
\end{array}\right\rfloor \sigma_{e}^{-2} \\
& \Rightarrow C_{e_{d}} R^{-1} \hat{e}=D_{n d} d_{11}\left(I+D_{n d} g_{11}\right)^{-1}\left[y_{n}-X_{n} b^{\circ}-P_{n p, d}\left(1 / 2 \hat{u}_{p d}\right)-Z_{n m} \hat{u}_{d m}-Z_{n d p} \hat{p}_{d m}\right]
\end{aligned}
$$

Thus, the prediction of the BV for all nonparents is:
$\hat{u}_{n d}=P_{n p, d}\left(1 / 2 \hat{u}_{p d}\right)+D_{n d} g_{11}\left(I+D_{n d} g_{11}\right)^{-1}\left[y_{n}-X_{n} b^{\circ}-P_{n p, d}\left(1 / 2 \hat{u}_{p d}\right)-Z_{n m} \hat{u}_{d m}-Z_{n d p} \hat{p}_{d m}\right]$
and the prediction of the BV for direct effects for the $\mathrm{i}^{\text {th }}$ nonparent is:

$$
\begin{aligned}
& \hat{u}_{n i, d}=1 / 2\left(\hat{u}_{\mathrm{sid}^{\mathrm{d}}}+\hat{\mathrm{u}}_{\mathrm{di}}\right)+\frac{\mathrm{d}_{\mathrm{ii}} \mathrm{~g}_{11}}{1+\mathrm{d}_{\mathrm{ii}} \mathrm{~g}_{11}}\left[\mathrm{y}_{\mathrm{n}_{\mathrm{i}}}-\mathrm{b}_{\mathrm{ni}_{\mathrm{i}}}{ }^{\circ}-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{sid}}+\hat{\mathrm{u}}_{\mathrm{di}} \mathrm{~d}\right)-\hat{\mathrm{u}}_{\mathrm{di}} \mathrm{~m}-\hat{\mathrm{p}}_{\mathrm{p}_{\mathrm{i}} \mathrm{~m}}\right] \\
& =1 / 2\left(\hat{u}_{s_{i} \mathrm{~d}}+\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~d}}\right)+\frac{\mathrm{g}_{11}}{\mathrm{~d}^{i \mathrm{i}}+\mathrm{g}_{11}}\left[\mathrm{y}_{\mathrm{n}_{\mathrm{i}}}-\mathrm{b}_{\mathrm{n}_{\mathrm{i}}}^{\circ}-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{si}} \mathrm{~d}+\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~d}}\right)-\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~m}}-\hat{p}_{\mathrm{p}_{\mathrm{i}} \mathrm{~m}}\right]
\end{aligned}
$$

(ii) Additive maternal genetic effects

$$
\begin{align*}
& \hat{u}_{n m}=C_{u_{m}} G^{-1} \hat{u}+C_{e_{m}} R^{-1} \hat{e}  \tag{19-11}\\
& \mathrm{C}_{\mathrm{u}_{\mathrm{m}}}=\operatorname{cov}\left(1 / 2 \mathrm{P}_{\mathrm{np}, \mathrm{~m}} \mathrm{u}_{\mathrm{m}}+\phi_{\mathrm{nm}},\left[\mathrm{u}_{\mathrm{pd}}, \vdots_{\mathrm{u}_{\mathrm{pm}}}, \vdots \mathrm{p}_{\mathrm{dm}}^{\prime}\right]\right) \\
& =\left[1 / 2 P_{n p, m} A_{p p} g_{12} \vdots 1 / 2 P_{n p, m} A_{p p} g_{22} \vdots 0\right] \sigma_{\mathrm{e}}^{2} \\
& \Rightarrow \mathrm{C}_{\mathrm{u}_{\mathrm{m}}} \mathrm{G}^{-1} \hat{\mathrm{u}}=\mathrm{P}_{\mathrm{np}, \mathrm{~m}}\left(1 / 2 \hat{u}_{\mathrm{pm}}\right) \\
& \mathrm{C}_{\mathrm{e}_{\mathrm{m}}}=\operatorname{cov}\left(1 / 2 \mathrm{P}_{\mathrm{np}, \mathrm{~m}} \mathrm{u}_{\mathrm{m}}+\phi_{\mathrm{m}},\left[\mathrm{e}_{\mathrm{p}},:_{\varepsilon_{\mathrm{n}}}{ }^{\prime}\right]\right) \\
& =\left[0 \vdots \mathrm{D}_{\mathrm{nd}} \mathrm{~g}_{12}\right] \sigma_{\mathrm{e}}^{2} \\
& \Rightarrow C_{e_{m}} R^{-1} \hat{e}=D_{n g} g_{12}\left(I+D_{n d} g_{11}\right)^{-1}\left[y_{n}-X_{n} b^{\circ}-P_{n p, d}\left(1 / 2 \hat{u}_{p d}\right)-Z_{n m} \hat{u}_{d m}-Z_{n d p} \hat{p}_{d m}\right]
\end{align*}
$$

Thus, the prediction of BV for maternal effects for all nonparents is:
$u_{n \mathrm{~m}}=1 / 2\left(\hat{u}_{\mathrm{sim}}+\hat{u}_{\mathrm{dim}}\right)+\mathrm{D}_{\mathrm{nd}} \mathrm{g}_{12}\left(\mathrm{I}+\mathrm{D}_{\mathrm{nd}} \mathrm{g}_{11}\right)^{-1}\left[\mathrm{y}_{\mathrm{n}}-\mathrm{b}_{\mathrm{ni}}{ }^{\circ}-P_{\mathrm{npp}, \mathrm{d}}\left(1 / 2 \hat{u}_{\mathrm{pd}}\right)-\mathrm{Z}_{\mathrm{nm}} \hat{u}_{\mathrm{dm}}-\mathrm{Z}_{\mathrm{ndp}} \hat{\mathrm{p}}_{\mathrm{dm}}\right]$ and the prediction of the BV for maternal effects for the $\mathrm{i}^{\text {th }}$ nonparent is:

$$
\begin{aligned}
& \hat{u}_{n i m}=1 / 2\left(\hat{u}_{\mathrm{sim}}+\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~m}}\right)+\frac{\mathrm{d}_{\mathrm{ii}} \mathrm{~g}_{12}}{1+\mathrm{d}_{\mathrm{ii}} \mathrm{~g}_{11}}\left[\mathrm{y}_{\mathrm{ni}}-\mathrm{b}_{\mathrm{ni}}{ }^{\circ}-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{si}}+\hat{\mathrm{u}}_{\mathrm{d} \mathrm{i}}\right)-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{d} \mathrm{i} \mathrm{~m}}\right)-\hat{\mathrm{p}}_{\mathrm{di} \mathrm{~m}}\right] \\
& =1 / 2\left(\hat{\mathrm{u}}_{\mathrm{sim}}+\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~m}}\right)+\frac{\mathrm{g}_{12}}{\mathrm{~d}^{\mathrm{ii}}+\mathrm{g}_{11}}\left[\mathrm{y}_{\mathrm{ni}_{\mathrm{i}}}-\mathrm{b}_{\mathrm{ni}}{ }^{\circ}-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{si} \mathrm{~d}}+\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~d}}\right)-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~m}}\right)-\hat{\mathrm{p}}_{\mathrm{di} \mathrm{~m}}\right]
\end{aligned}
$$

Note that:

$$
\begin{aligned}
\frac{\mathrm{g}_{12}}{\mathrm{~d}^{\mathrm{ii}}+\mathrm{g}_{11}} & =\frac{\frac{\mathrm{g}_{12}}{g_{11}}}{\frac{\left(\mathrm{~d}^{\mathrm{ii}}+\mathrm{g}_{11}\right)}{\mathrm{g}_{11}}} \\
& =\left(\frac{\mathrm{g}_{12}}{g_{11}}\right)\left(\frac{\mathrm{g}_{11}}{\mathrm{~d}^{\mathrm{ii}}+\mathrm{g}_{11}}\right)
\end{aligned}
$$

Thus,

$$
\begin{equation*}
\hat{\mathrm{u}}_{\mathrm{n} \mathrm{i}}=1 / 2\left(\hat{\mathrm{u}}_{\mathrm{si} \mathrm{~m}}+\hat{\mathrm{u}}_{\mathrm{d} \mathrm{~m}}\right)+\frac{\mathrm{g}_{12}}{\mathrm{~g}_{11}} \hat{\phi}_{\mathrm{n} \mathrm{i}} \tag{19-12}
\end{equation*}
$$

where

$$
\hat{\phi}_{\mathrm{n}_{\mathrm{i}} \mathrm{~d}}=\frac{\mathrm{g}_{11}}{\mathrm{~d}^{\mathrm{ii}}+\mathrm{g}_{11}}\left[\mathrm{y}_{\mathrm{n}_{\mathrm{i}}}-\mathrm{b}_{\mathrm{ni}_{\mathrm{i}}}^{\circ}-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{sid}^{\mathrm{d}}}+\hat{\mathrm{u}}_{\mathrm{d}_{\mathrm{i}} \mathrm{~d}}\right)-1 / 2\left(\hat{\mathrm{u}}_{\mathrm{di} \mathrm{~m}}\right)+\hat{\mathrm{p}}_{\mathrm{di} \mathrm{~m}}\right]
$$

## Remarks:

Because nonparent BV $\left(u_{i}\right)$ are defined as $1 / 2 u_{s}+1 / 2 u_{d}+\varphi$ in DM2RAM, the number of effects for a nonparent is 1 more than the number of effects for a parent. For example, if there is one fixed effect, the number of effects for a parent in DM2RAM is 4 and for a nonparent is 5. Hence, the number of contributions to the MME is substantially larger for a nonparent than for a parent, e.g., for a half-stored LHS matrix:

> No. effects No. contributions

Parent
Nonparent

4

$$
4(4+1) / 2=10
$$

$$
5(5+1) / 2=15
$$

Since nonparents usually constitute the largest group, it would be advantageous to use an equivalent DM2RAM which reduces the number of contributions of nonparents to the MME. Quaas et al. (1984) noticed that:
(i) $P_{n p, d}=P_{n s, d}+P_{n d, d}$
where
$\mathrm{P}_{\mathrm{ns}, \mathrm{d}}=$ incidence matrix relating nonparent BV to their sire BV for direct effects
$\mathrm{P}_{\mathrm{nd}, \mathrm{d}}=$ incidence matrix relating nonparent BV to their dam BV for direct effects
(ii) $Z_{n m}=P_{n d, d}$

Thus, the set of equations for nonparents can be written as:

$$
\begin{equation*}
y_{\mathrm{n}}=\mathrm{X}_{\mathrm{n}} \mathrm{~b}+1 / 2 \mathrm{P}_{\mathrm{ns}, \mathrm{~d}} \mathrm{u}_{\mathrm{pd}}+1 / 2 \mathrm{P}_{\mathrm{nd}, \mathrm{~d}} \mathrm{u}_{\mathrm{pd}}+\mathrm{P}_{\mathrm{nd}, \mathrm{~d}} \mathrm{u}_{\mathrm{pm}}+\mathrm{Z}_{\mathrm{ndp}} \mathrm{p}_{\mathrm{dm}}+\varepsilon_{\mathrm{n}} \tag{19-13}
\end{equation*}
$$

where

$$
\varepsilon_{\mathrm{n}}=\phi_{\mathrm{nd}}+\mathrm{p}_{\mathrm{nd}}+\mathrm{e}_{\mathrm{nd}}+\mathrm{e}_{\mathrm{nm}}
$$

The model for $\mathrm{y}_{\mathrm{n}}$ can be rewritten as:

$$
\mathrm{y}_{\mathrm{n}}=\mathrm{X}_{\mathrm{n}} \mathrm{~b}+1 / 2 \mathrm{P}_{\mathrm{ns}, \mathrm{~d}} \mathrm{u}_{\mathrm{pd}}+\mathrm{P}_{\mathrm{nd}}\left(1 / 2 \mathrm{u}_{\mathrm{pd}}+\mathrm{u}_{\mathrm{pm}}\right)+\mathrm{Z}_{\mathrm{ndp}} \mathrm{p}_{\mathrm{dm}}+\varepsilon_{\mathrm{n}}
$$

The equations for parents were:

$$
\mathrm{y}_{\mathrm{p}}=\mathrm{X}_{\mathrm{p}} \mathrm{~b}+\mathrm{Z}_{\mathrm{pd}} \mathrm{u}_{\mathrm{pd}}+\mathrm{Z}_{\mathrm{pm}} \mathrm{u}_{\mathrm{pm}}+\mathrm{Z}_{\mathrm{pdp}} \mathrm{p}_{\mathrm{dm}}+\mathrm{e}_{\mathrm{p}}
$$

where

$$
\mathrm{e}_{\mathrm{p}}=\mathrm{p}_{\mathrm{pd}}+\mathrm{e}_{\mathrm{pd}}+\mathrm{e}_{\mathrm{pm}}
$$

The parental model must now be rewritten to match the nonparental model as follows:

$$
y_{p}=X_{p} \mathrm{~b}+\left(Z_{p d}-1 / 2 Z_{p m}\right) u_{p d}+Z_{p m}\left(1 / 2 u_{p d}+u_{p m}\right)+Z_{p d p} p_{d m}+e_{p}
$$

Let

$$
u_{\mathrm{pdm}}=1 / 2 u_{\mathrm{pd}}+u_{\mathrm{pm}}
$$

Thus, the equivalent DM2RAM, i.e., the EDM2RAM, is:

$$
\begin{aligned}
& {\left[\begin{array}{l}
y_{p} \\
y_{n}
\end{array}\right]=\left[\begin{array}{l}
X_{p} \\
X_{n}
\end{array}\right] b+\left[\begin{array}{c}
Z_{p d}-1 / 2 Z_{p m} \\
1 / 2 P_{n s, d}
\end{array}\right] u_{p d}+\left[\begin{array}{c}
Z_{p m} \\
P_{n d}
\end{array}\right] u_{p d m}+\left[\begin{array}{l}
Z_{p d p} \\
Z_{\mathrm{ndp}}
\end{array}\right] \mathrm{p}_{\mathrm{dm}}+\left[\begin{array}{l}
\mathrm{e}_{\mathrm{p}} \\
\varepsilon_{\mathrm{n}}
\end{array}\right]} \\
& E\left[\begin{array}{l}
\mathrm{y}_{\mathrm{p}} \\
\mathrm{y}_{\mathrm{n}}
\end{array}\right]=\left[\begin{array}{l}
X_{\mathrm{p}} \\
X_{\mathrm{n}}
\end{array}\right]
\end{aligned}
$$

## Example:

A numerical example for the EDM2RAM with the dataset used for the AM and RAM models for direct additive genetic effects only (Chapter 16) is shown in the output of the SAS IML program for this chapter.

## Remarks:

(i) The MME for the EDM2RAM are more sparse than those for DM2RAM.
(ii) There will be a covariance between $\mathbf{u}_{\mathrm{pd}}$ and $\mathbf{u}_{\mathrm{pdm}}$ even if $\mathrm{g}_{12}$ is zero.

The MME for the EDM2RAM are:

$$
\begin{aligned}
& X_{p}{ }^{\prime} X_{p}+X_{n}{ }^{\prime} R_{n}^{-1} X_{n} \quad X_{p}{ }^{\prime}\left(Z_{p d}-1 / 2 Z_{p m}\right)+X_{n}{ }^{\prime} R_{n}^{-1} \mathrm{P}_{\mathrm{ns}, \mathrm{~d}}(1 / 2) \quad \mid \\
& \left(Z_{p d}{ }^{\prime}-1 / 2 Z_{p m}{ }^{\prime}\right) X_{p}+(1 / 2) P_{n s, d}{ }^{\prime} R^{-1} X_{n}\left|\left(Z_{p d}{ }^{\prime}-1 / 2 Z_{p m}{ }^{\prime}\right)\left(Z_{p d}-1 / 2 Z_{p m}\right)+(1 / 2) P_{n s, d}, R_{n}^{-1} P_{n s, d}(1 / 2)+A_{p p}^{-1} * g^{11} \quad\right| \\
& Z_{p m}{ }^{\prime} X_{p}+P_{n d}{ }^{\prime} R_{n}^{-1} X_{n}\left|\quad Z_{p m}{ }^{\prime}\left(Z_{p d}-1 / 2 Z_{p m}\right)+P_{n d}{ }^{\prime} \mathrm{R}_{n}^{-1} \mathrm{P}_{\mathrm{ns}, \mathrm{~d}}(1 / 2)+\mathrm{A}_{\mathrm{pp}}^{-1} * \mathrm{~g}^{12}\right| \\
& \mathrm{Z}_{\mathrm{pdp}}{ }^{\prime} \mathrm{X}_{\mathrm{p}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{X}_{\mathrm{n}}\left|\quad \mathrm{Z}_{\mathrm{pdp}}{ }^{\prime}\left(\mathrm{Z}_{\mathrm{pd}}-1 / 2 \mathrm{Z}_{\mathrm{pm}}\right)+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{P}_{\mathrm{ns}, \mathrm{~d}}(1 / 1 / 2)\right|
\end{aligned}
$$

$$
\begin{align*}
& X_{p}{ }^{\prime} Z_{p m}+X_{n}{ }^{\prime} R_{n}^{-1} P_{n d} \quad X_{p}{ }^{\prime} Z_{p d p}+X_{n}{ }^{\prime} R_{n}^{-1} Z_{n d p}  \tag{19-15}\\
& \left(Z_{p d}{ }^{\prime}-1 / 2 Z_{p m}{ }^{\prime}\right) Z_{p m}+(1 / 2) P_{n s, d}{ }^{\prime} R_{n}^{-1} P_{n d}+A_{p p}^{-1} * g^{12} \mid\left(Z_{p d}-1 / 2 Z_{p m}{ }^{\prime}\right) Z_{p d p}+(1 / 2) P_{n s, d}{ }^{\prime} R_{n}^{-1} Z_{n d p} \\
& \mathrm{Z}_{\mathrm{pm}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+\mathrm{P}_{\mathrm{nd}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{P}_{\mathrm{nd}}+\mathrm{A}_{\mathrm{pp}}^{-1} * \mathrm{~g}^{22} \mid \quad \mathrm{Z}_{\mathrm{pm}}{ }^{\prime} \mathrm{Z}_{\mathrm{pdp}}+\mathrm{P}_{\mathrm{nd}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{ndp}} \\
& \left.\mathrm{Z}_{\mathrm{pdp}}{ }^{\prime} \mathrm{Z}_{\mathrm{pm}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{P}_{\mathrm{nd}} \mid \quad \mathrm{Z}_{\mathrm{pdp}}{ }^{\prime} \mathrm{Z}_{\mathrm{pdp}}+\mathrm{Z}_{\mathrm{ndp}}{ }^{\prime} \mathrm{R}_{\mathrm{n}}^{-1} \mathrm{Z}_{\mathrm{ndp}}+\mathrm{I} \gamma^{-1}\right] \\
& {\left[\begin{array}{r}
b \\
u_{p d} \\
u_{p d m} \\
p_{d m}
\end{array}\right]=\left[\begin{array}{r}
X_{p}{ }^{\prime} y_{p}+X_{n}{ }^{\prime} R_{n}^{-1} y_{n} \\
\left(Z_{p d}{ }^{\prime}-1 / 2 Z_{p m}{ }^{\prime}\right) y_{p}+(1 / 2) P_{n s, d}{ }^{\prime} R_{n}^{-1} y_{n} \\
Z_{p m}{ }^{\prime} y_{p}+P_{n d}{ }^{\prime} R_{n}^{-1} y_{n} \\
Z_{p d p}{ }^{\prime} y_{p}+Z_{n d p}{ }^{\prime} R_{n}^{-1} y_{n}
\end{array}\right]}
\end{align*}
$$

The solutions to the MME for the DM2RAM and the EDM2RAM are related as follows:

$$
\begin{aligned}
& {\left[\begin{array}{c}
\hat{\mathrm{u}}_{\mathrm{pd}} \\
\hat{\mathrm{u}}_{\mathrm{pm}} \\
\hat{\mathrm{p}}_{\mathrm{dm}}
\end{array}\right]=\left[\begin{array}{rrr}
\mathrm{I} & 0 & 0 \\
-1 / 2 \mathrm{I} & \mathrm{I} & 0 \\
0 & 0 & \mathrm{I}
\end{array}\right]\left[\begin{array}{c}
\hat{\mathrm{u}}_{\mathrm{pd}} \\
\hat{\mathrm{u}}_{\mathrm{pdm}} \\
\hat{\mathrm{p}}_{\mathrm{dm}}
\end{array}\right]} \\
& \begin{array}{l}
\downarrow \\
\text { DM2RAM }
\end{array} \begin{array}{l}
\downarrow \\
\text { EDM2RAM }
\end{array} \\
& \text { and }
\end{aligned}
$$

Remarks:
(i) Approximations to DM2RAM and EDM2RAM can be obtained (e.g., sire-dam (DM2SDM), sire-maternal grandsire (DM2SMM), etc.) by means of procedures similar to those used for the approximations to RAM.
(ii) Maternal and permanent environment effects (i.e., $\mathrm{u}_{\mathrm{pdm}}$ and $\mathrm{p}_{\mathrm{dm}}$ ) can be combined into a single effect. However, $\operatorname{var}\left[\begin{array}{r}u_{p d} \\ u_{p d m}+p_{d m}\end{array}\right]$ is rather difficult to invert. An easier alternative is to put
$\left[\begin{array}{l}Z_{p d p} \\ Z_{n d p}\end{array}\right]$ pdm in the residual. This is equivalent to absorbing $p_{d m}$ into $b, u_{p d}$ and $u_{p d m}$.
The new residual term is:

$$
\left[\begin{array}{c}
\mathrm{e}_{\mathrm{p}}^{*} \\
\mathrm{e}_{\mathrm{n}}^{*}
\end{array}\right]-\left[\begin{array}{l}
\mathrm{Z}_{\mathrm{pdp}} \mathrm{p}_{\mathrm{dm}}+\mathrm{e}_{\mathrm{p}} \\
\mathrm{Z}_{\mathrm{ndp}} \mathrm{p}_{\mathrm{dm}}+\varepsilon_{\mathrm{n}}
\end{array}\right]
$$

and its variance is:

$$
\left.\begin{array}{rl}
\operatorname{var}\left[\begin{array}{c}
\mathrm{e}_{\mathrm{p}}^{*} \\
\mathrm{e}_{\mathrm{n}}^{*}
\end{array}\right] & =\left[\left.\begin{array}{r}
0 \\
\mathrm{Z}_{\mathrm{pdp}} \mathrm{Z}_{\mathrm{pdp}}^{\prime} \gamma+\mathrm{I} \\
0
\end{array} \right\rvert\,\right. \\
& \mid \mathrm{Z}_{\mathrm{ndp}} \mathrm{Z}_{\mathrm{ndp}}, \gamma+\mathrm{D}_{\mathrm{nd}} \mathrm{~g}_{11}+\mathrm{I}
\end{array}\right] \sigma_{\mathrm{e}}^{2} .
$$

Both $\mathrm{R}_{\mathrm{p}}{ }^{*}$ and $\mathrm{R}_{\mathrm{n}}{ }^{*}$ are block diagonal matrices. The elements of the $\mathrm{i}^{\text {th }}$ block of $\mathrm{R}_{\mathrm{p}}{ }^{*}$ are equal to:

$$
\begin{cases}\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}+\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2} & \text { diagonals } \\ \sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}+\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}} & \text { offdiagonals }\end{cases}
$$

and those of the $i^{\text {th }}$ block of $\mathrm{R}_{\mathrm{n}}{ }^{*}$ are equal to:

$$
\begin{cases}\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}+\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{d}}}^{2}+\sigma_{\mathrm{e}_{\mathrm{m}}}^{2}+\mathrm{d}_{\mathrm{ii}} \sigma_{\mathrm{dd}} & \text { diagonals } \\ \sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{m}}}}^{2}+\sigma_{\mathrm{E}_{\mathrm{p}_{\mathrm{d}}}}^{2} & \text { offdiagonals }\end{cases}
$$
