

## Accuracy of genomic-polygenic prediction for milk yield and fat percentage in the Thai dairy cattle population

**Danai Jattawa**, Skorn Koonawootrittriron,  
Mauricio A. Elzo and Thanathip Suwanasopee

Department of Animal Science, Faculty of Agriculture, Kasetsart University, Thailand  
Department of Animal Sciences, University of Florida, Gainesville, Florida USA

## Genomic evaluation

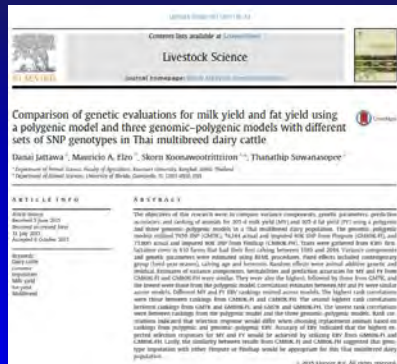

- ❖ Genomic evaluation combines pedigree, phenotypes, and genotypes to evaluate animals
- ❖ Genomic evaluation can increase prediction accuracy and rate of genetic progress

Countries	Accuracy (%)		Gain
	EBV	GBEV	
USA	35	58	23
Canada	39	63	24
New Zealand	34	67	32
Netherlands	35	61	26

## Dairy Genomic Evaluation in Thailand

Tropical Animal Genetic Unit

## Objectives

- ❑ To compare prediction accuracies and animal rankings for 305 -d MY and 305-d FP using genomic-polygenic and polygenic models
- ❑ To evaluate GPEBV trends for each trait as Holstein (H) fraction increased from 0% to 100%

Tropical Animal Genetic Unit

## Dataset

### Pedigree & Phenotypes

- ❑ 9,339 first-lactation cows
- ❑ 1,002 farms
- ❑ Daughters of 1,346 sires and 7,875 dams

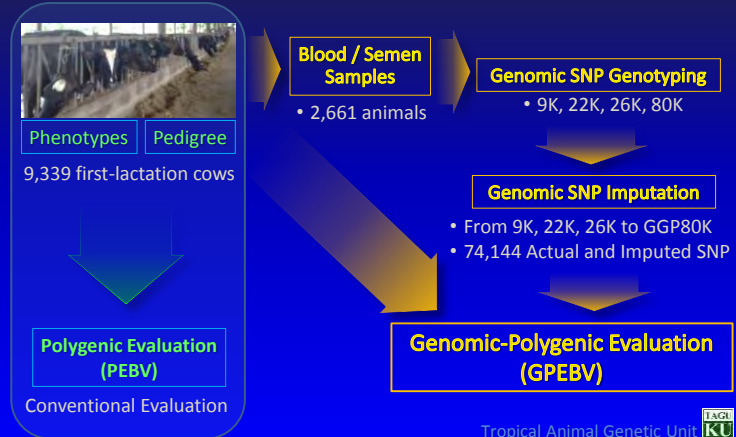

### Genotypes

- ❑ 2,661 animals (89 ♂; 2,572 ♀)
- ❑ GGP9K (n=1,412), GGP20K (n=570), GGP26K (n=540), GGP80K (n=139)

Tropical Animal Genetic Unit

## Polygenic and Genomic-Polygenic Evaluations

## Polygenic and Genomic-Polygenic Models

$$\mathbf{y} = \mathbf{Xb} + \mathbf{Z}_h\mathbf{h} + \mathbf{Za} + \mathbf{e}$$

$$\text{Var}(\mathbf{a}) = \mathbf{A} * \sigma_a^2 \text{ for polygenic model}$$

$$= \mathbf{H} * \sigma_a^2 \text{ for genomic-polygenic model}$$

### Fixed effects

- Herd-year-season
- Calving age
- Heterosis

### Random effects

- Additive genetic
- residual

$$\mathbf{H} = \begin{bmatrix} \mathbf{A}_{11} + \mathbf{A}_{12}\mathbf{A}_{22}^{-1}(\mathbf{G}_{22} - \mathbf{A}_{22})\mathbf{A}_{22}^{-1}\mathbf{G}_{21} & \mathbf{A}_{12}\mathbf{A}_{22}^{-1}\mathbf{G}_{22} \\ \mathbf{G}_{22}\mathbf{A}_{22}^{-1}\mathbf{A}_{21} & \mathbf{G}_{22} \end{bmatrix}$$

## Results and Discussion

Tropical Animal Genetic Unit

## Prediction accuracies for MY EBV from Genomic-Polygenic and Polygenic models

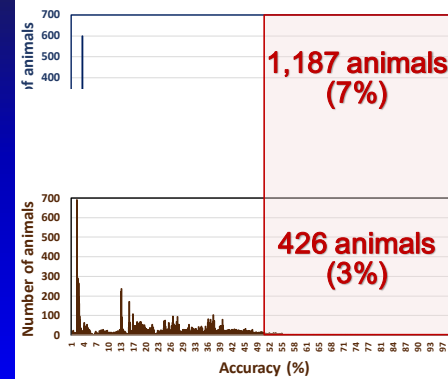

Genomic-Polygenic model

Tropical Animal Genetic Unit

## Prediction accuracies for FP EBV from Genomic-Polygenic and Polygenic models

Genomic-Polygenic model

Tropical Animal Genetic Unit

## Mean prediction accuracies from Genomic-Polygenic and Polygenic models

Type of animal	n	GPM		PM		Accuracy Increase
		MY	FP	MY	FP	
All animals	17,363	38.4	27.5	33.1	23.6	4.5
Non-genotyped animals	14,702	36.7	26.4	31.1	22.5	4.8
Genotyped animals	2,661	46.2	32.5	42.6	29.1	3.5
Genotyped cows	2,572	34.5	26.2	26.9	18.9	7.5
Genotyped sires	89	64.5	43.8	59.9	43.2	2.6
Genotyped proven sires	58	69.5	47.1	67.2	49.0	0.2
Genotyped young sires	31	42.3	26.5	27.5	12.5	14.4

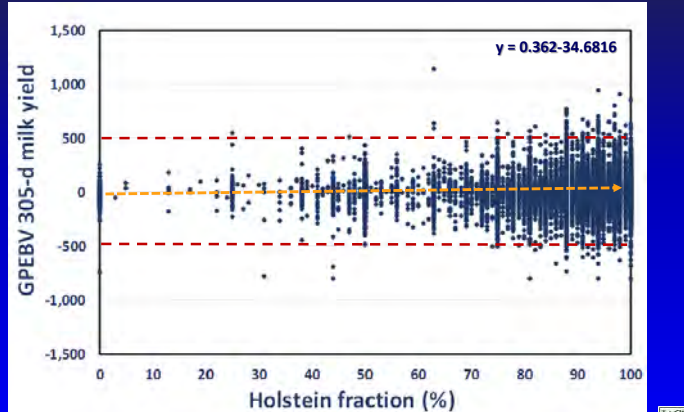

Tropical Animal Genetic Unit

## Rank correlations between GPEBV and PEBV for 305-d milk yield and 305-d fat percentage

Trait	Rank correlation	P-value
<b>All animals</b>		
305-d milk yield	0.88	<.0001
305-d fat percentage	0.83	<.0001
<b>Sires</b>		
305-d milk yield	0.91	<.0001
305-d fat percentage	0.87	<.0001
<b>Cows</b>		
305-d milk yield	0.88	<.0001
305-d fat percentage	0.82	<.0001

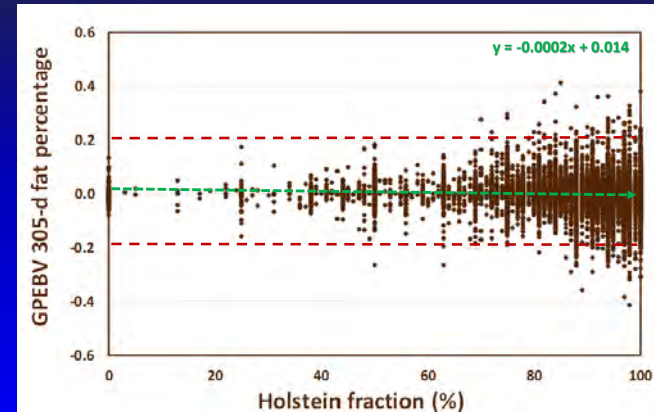

Tropical Animal Genetic Unit

### GPEBV as Holstein fraction increases from 0% to 100% for 305-d milk yield

Tropical Animal Genetic Unit 

### GPEBV as Holstein fraction increases from 0% to 100% for 305-d fat percentage

Tropical Animal Genetic Unit 

## Conclusions

- ☐ GPM yielded higher prediction accuracies than PM
- ☐ Rankings between GPEBV and PEBV were similar
- ☐ Animals with higher Holstein fraction tended to have higher GPEBV for MY, but lower GPEBV for FP than animals with lower Holstein fractions

Tropical Animal Genetic Unit 

## Implications

- ☐ Selection of animals with GPEBV would be yield higher rates of genetic change than with PEBV
- ☐ GPEBV would help shorten generation interval through earlier utilization of young sires evaluated with high accuracy
