

# Weed Science Research

Brent A. Sellers, Daniel G. Abe,  
and Jason A. Ferrell

# Introduction

- Aminocyclopyrachlor (ACP) is a new herbicide growth regulator (similar to aminopyralid).
- ACP will be sold as a premix:
  - Metsulfuron (Rejuvra)
  - Triclopyr (Invora)
  - Chlorsulfuron
  - 2,4-D amine

# General Methods

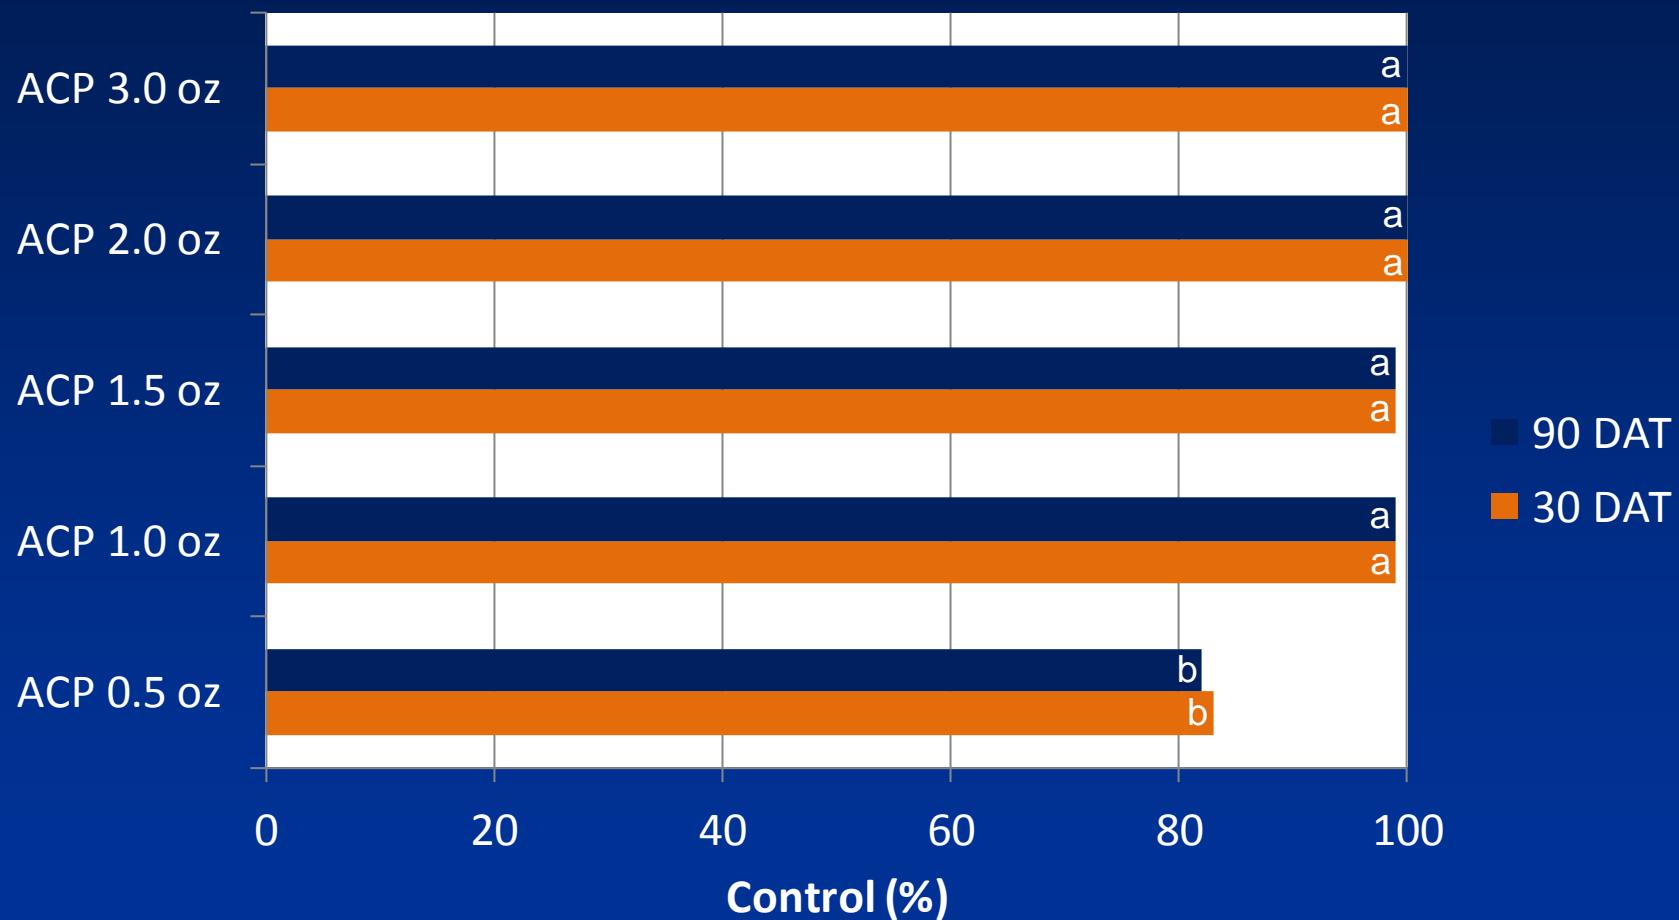

- Plot size: 20 by 50 ft
- RCBD, 4 replications
- Air pressurized ATV system
- 30 GPA

# Dogfennel

- Most problematic species in pastures
- Relatively easy to control

# Dogfennel with ACP Alone

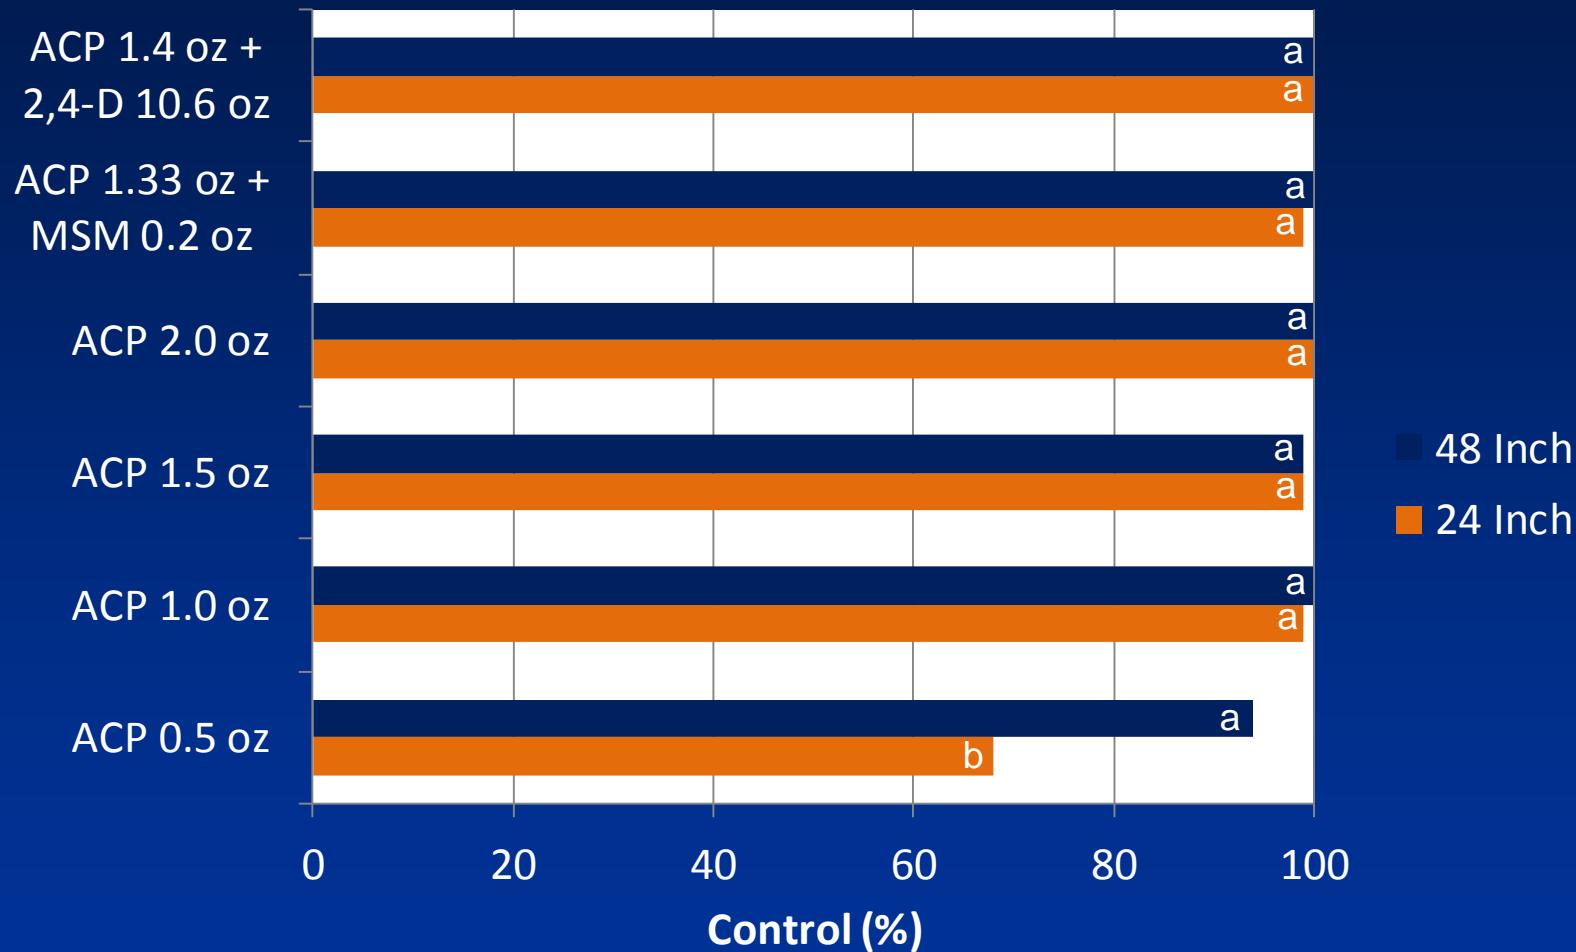

A photograph showing a field of tall, green grass. In the center, there is a lighter-colored, more open area that appears to be a path or a clearing. The grass is dense and reaches up to the top of the frame.

1 oz ai

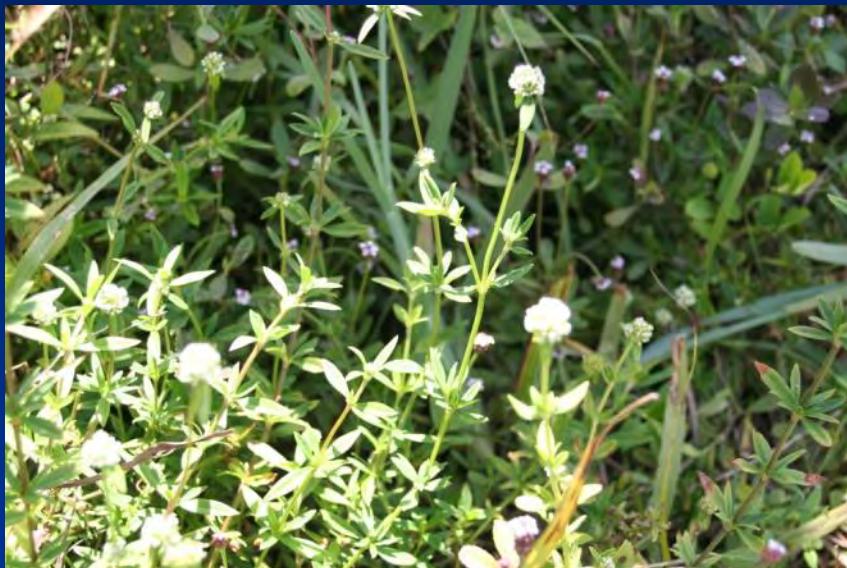

2 oz ai

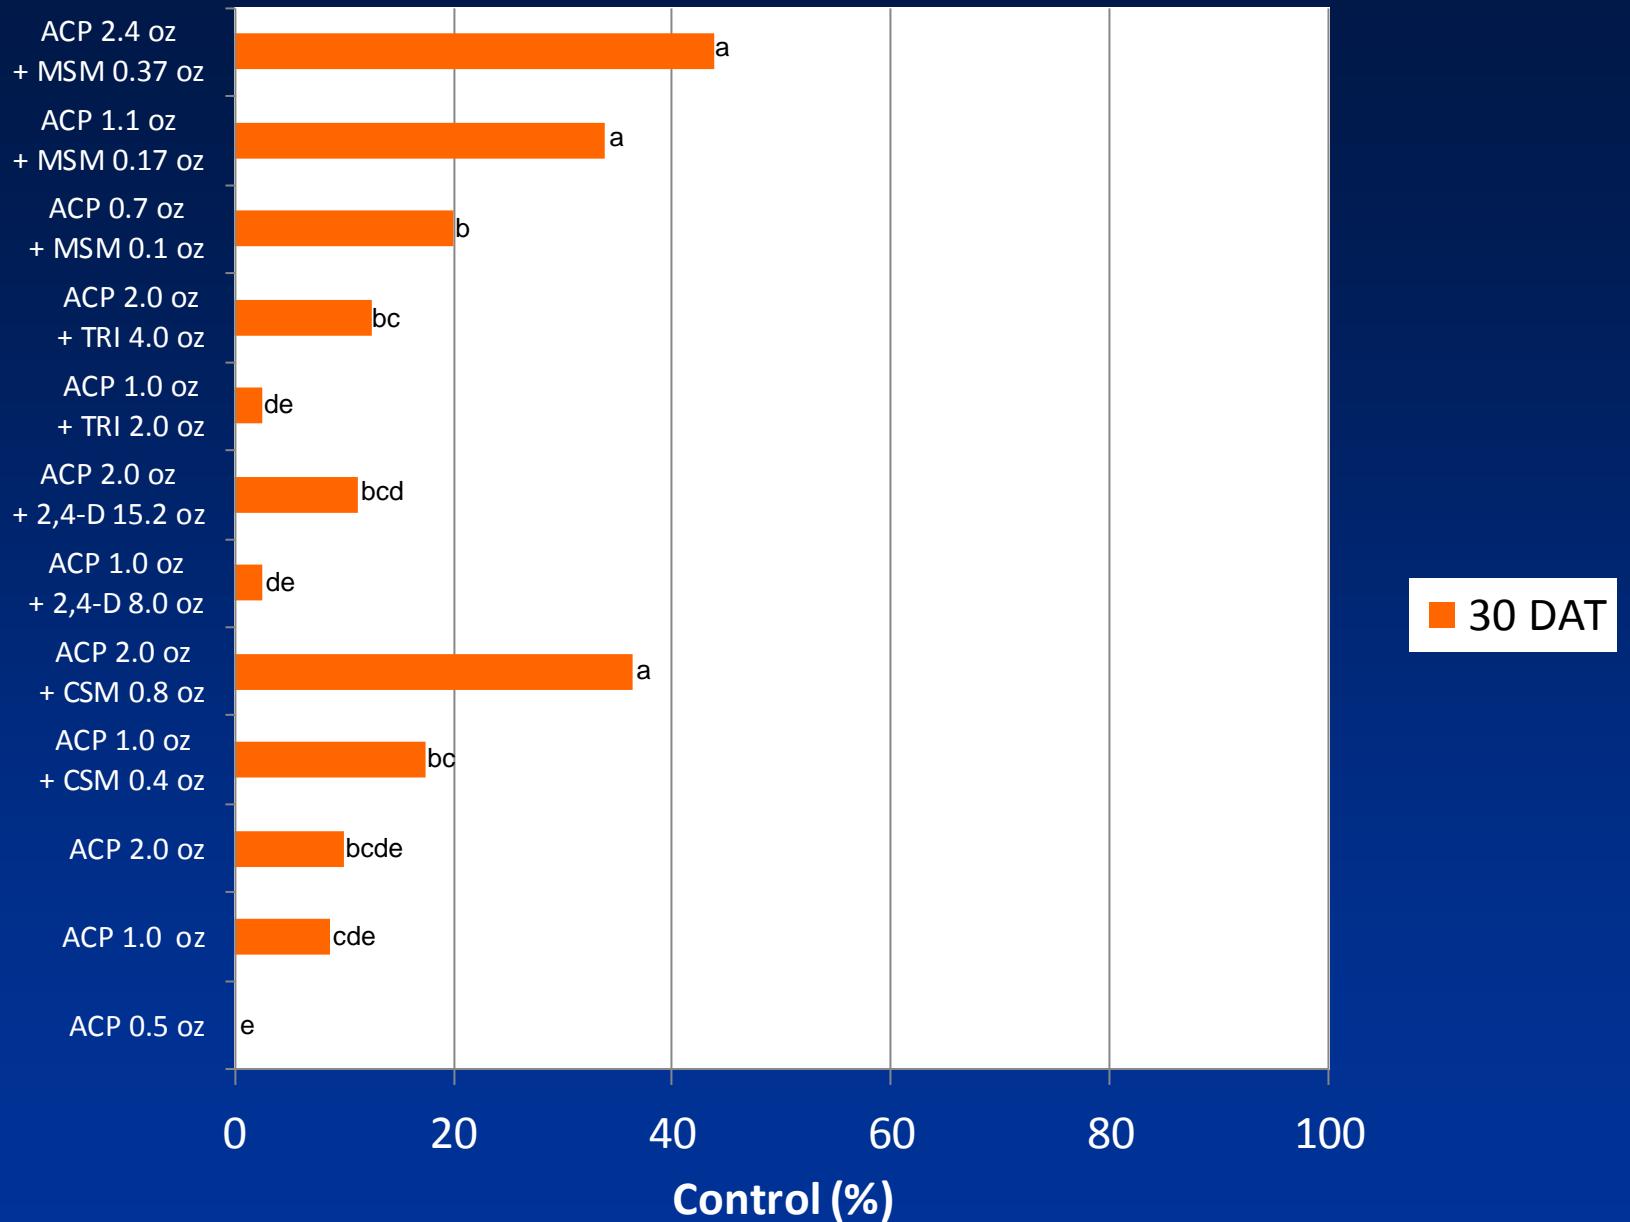

# St. John's Wort

# White Head Broom

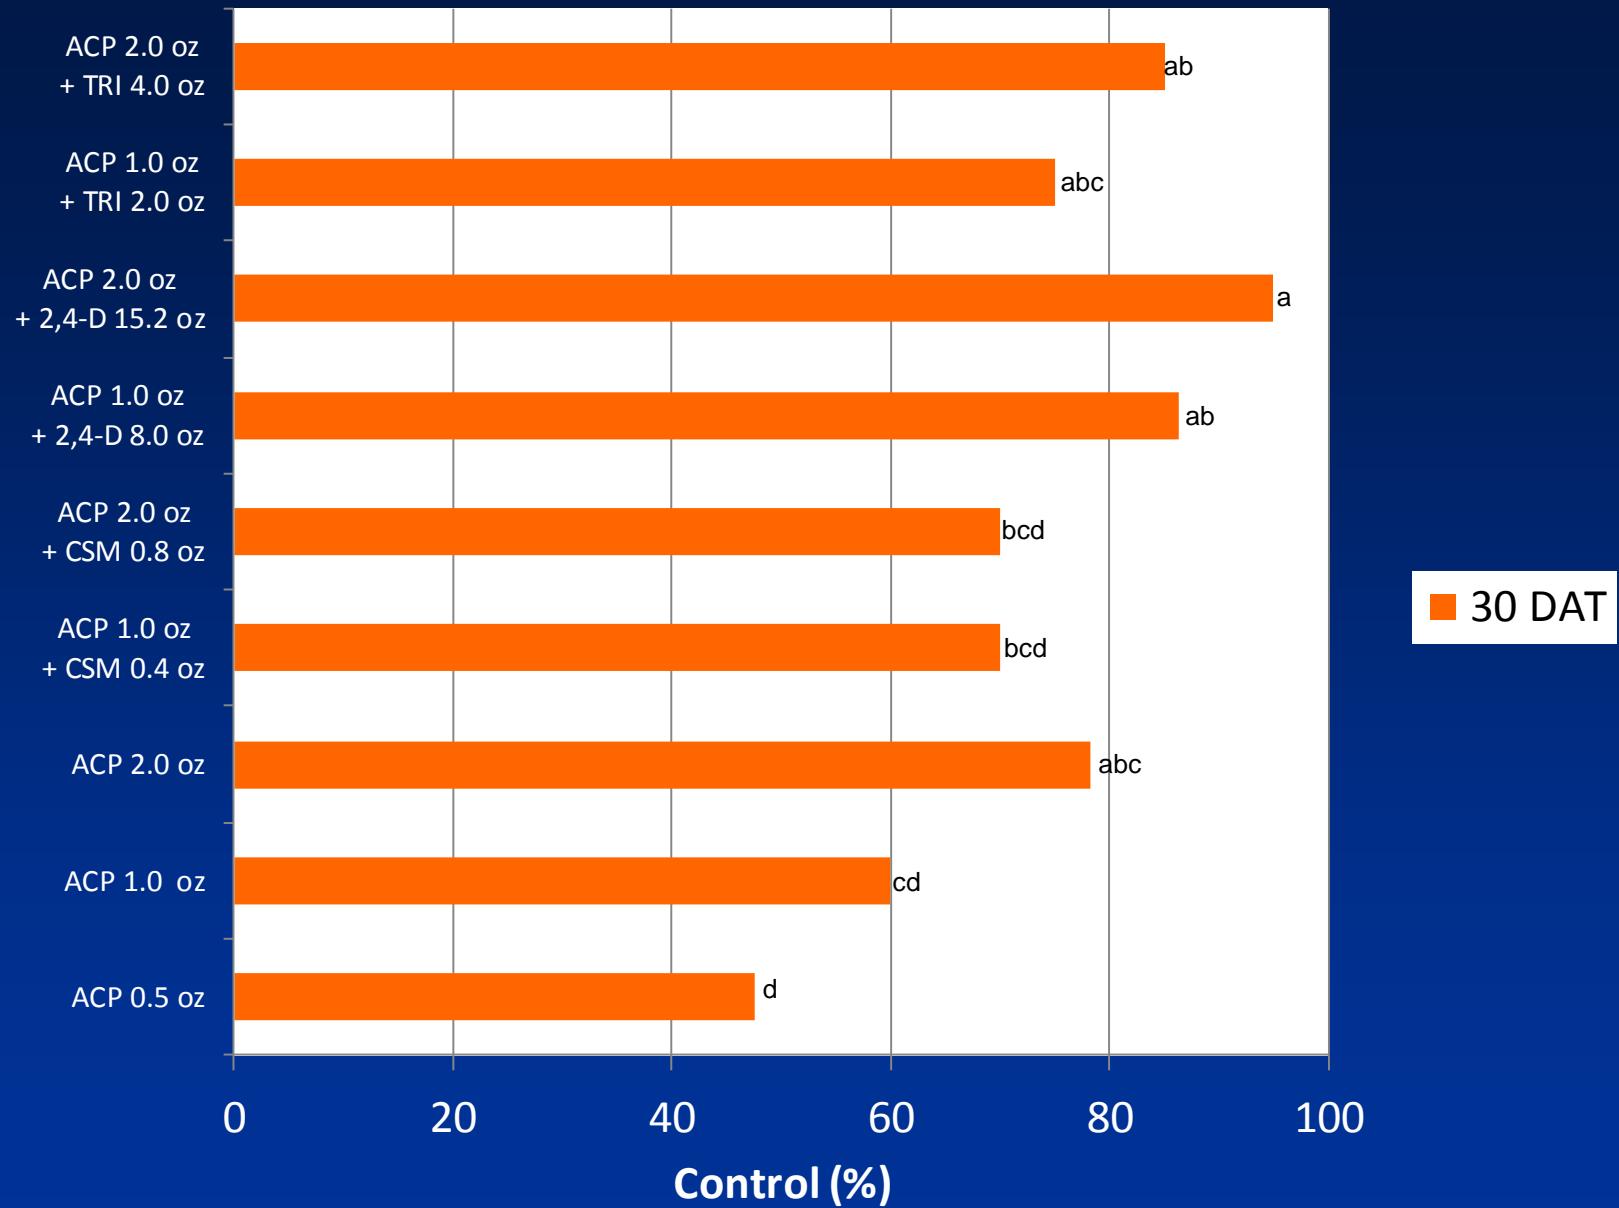

# Milkpea

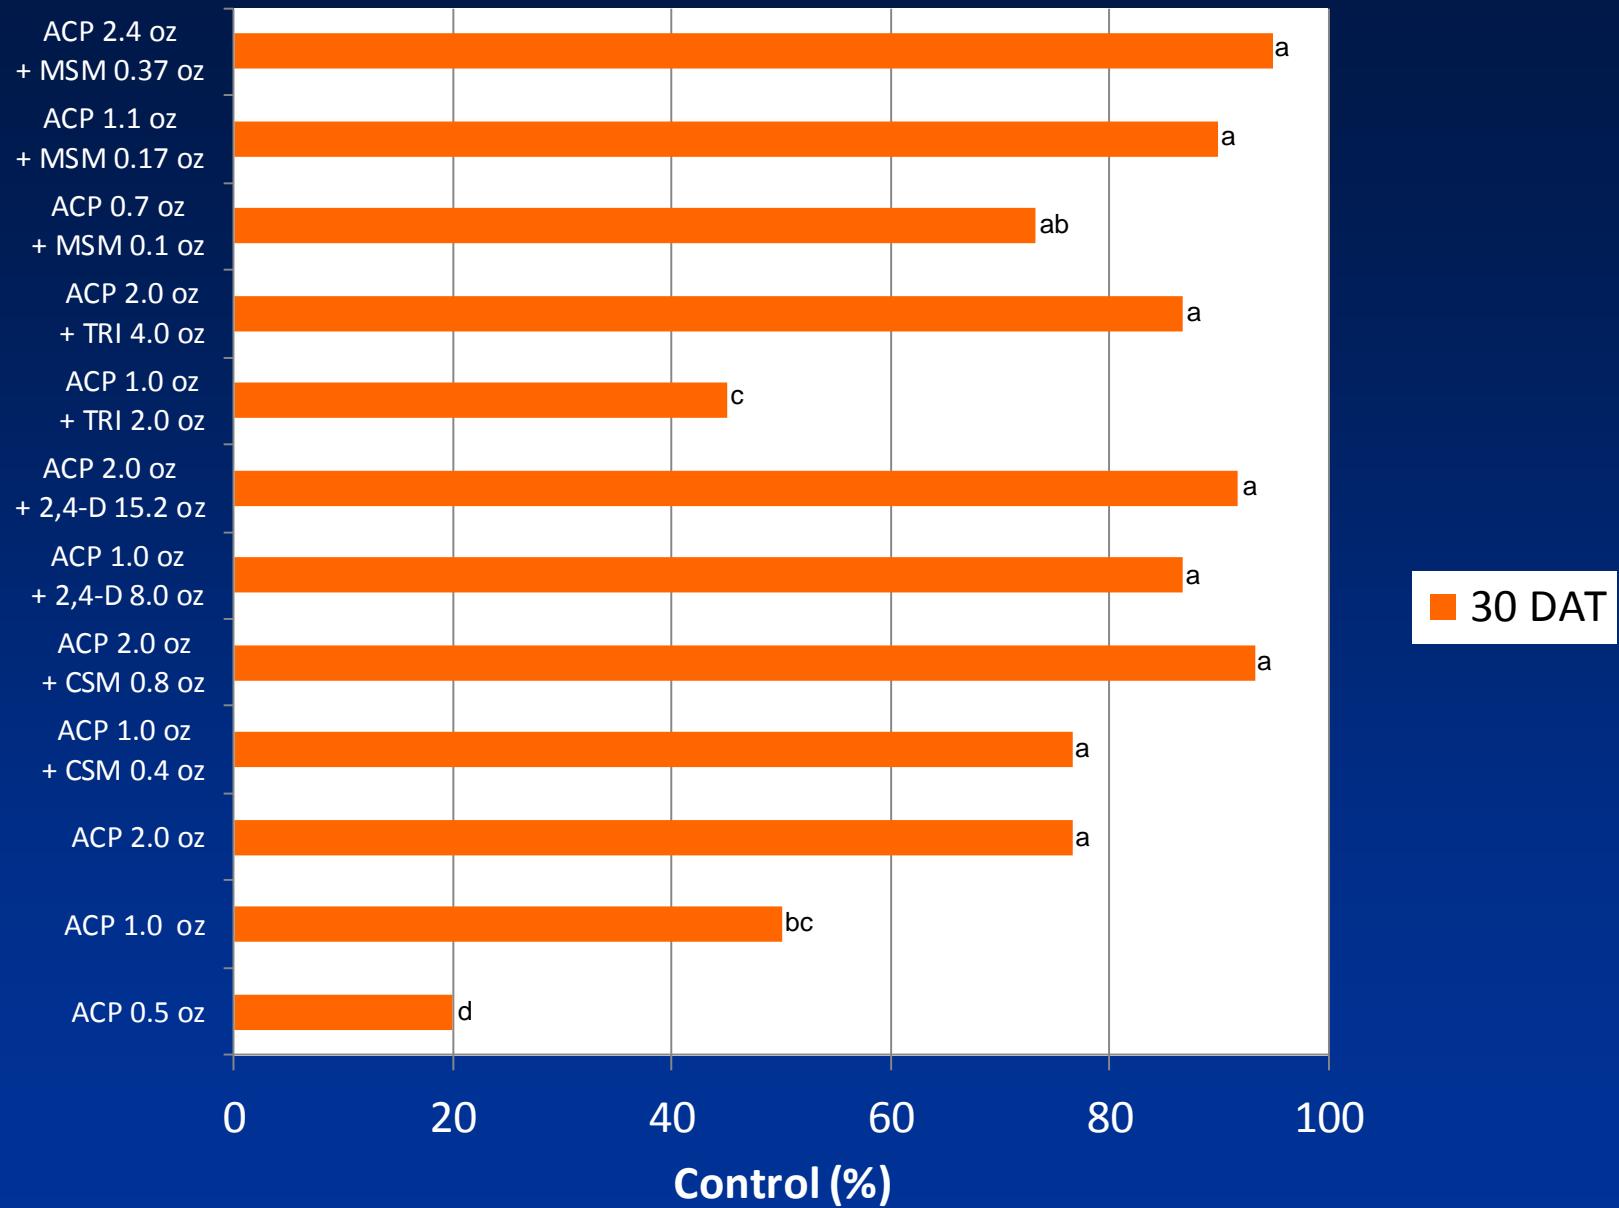

# Carolina/flat-top goldenrod

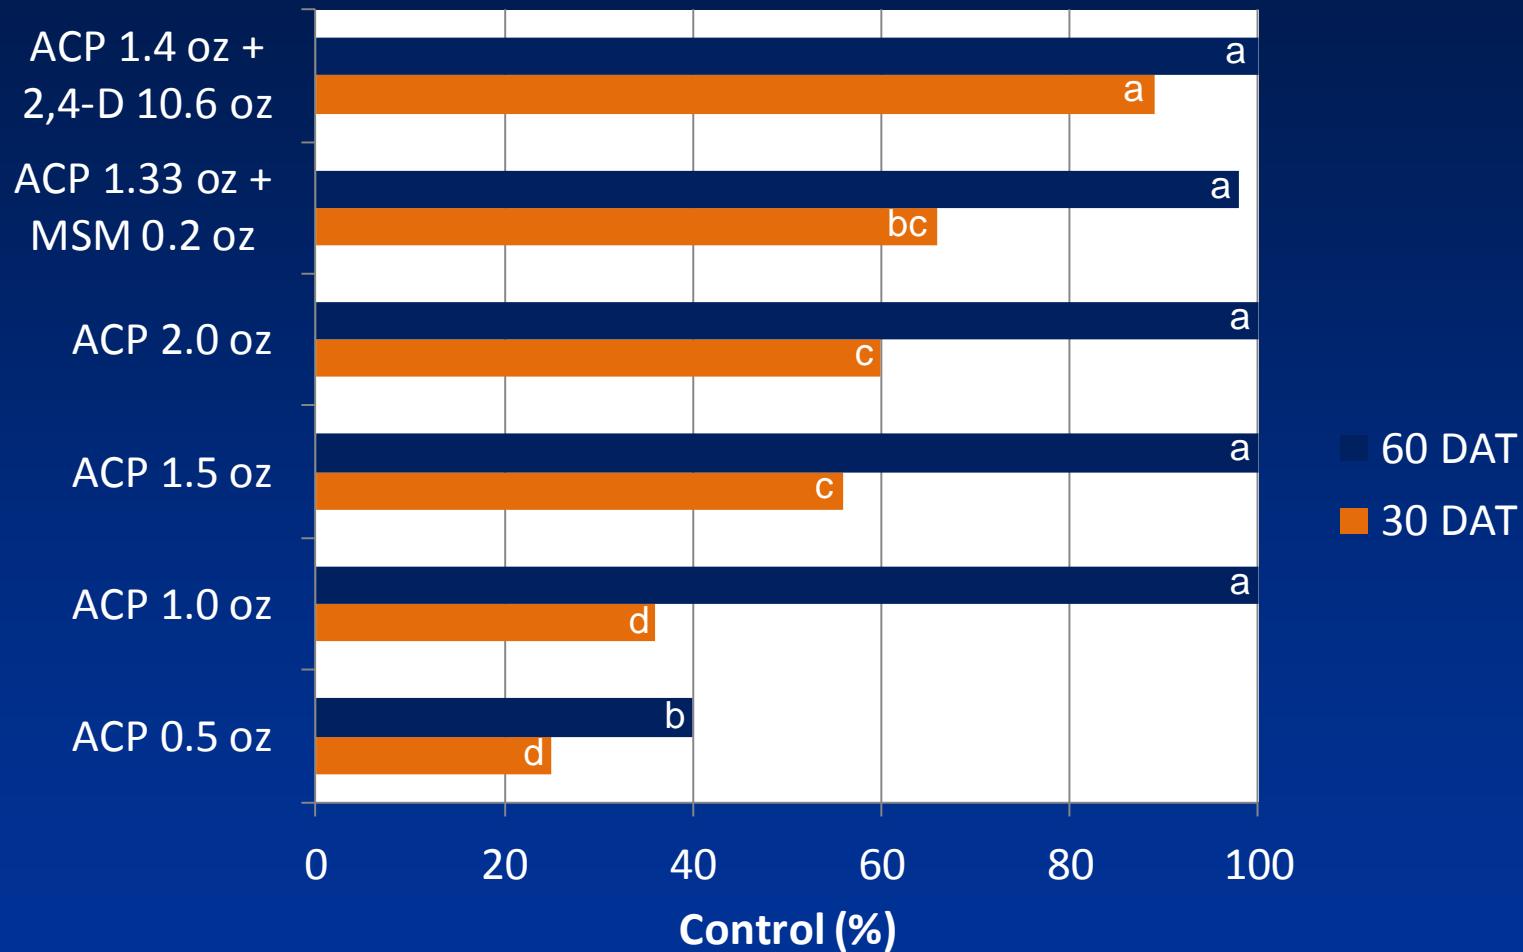

# Ragweed *Parthenium*

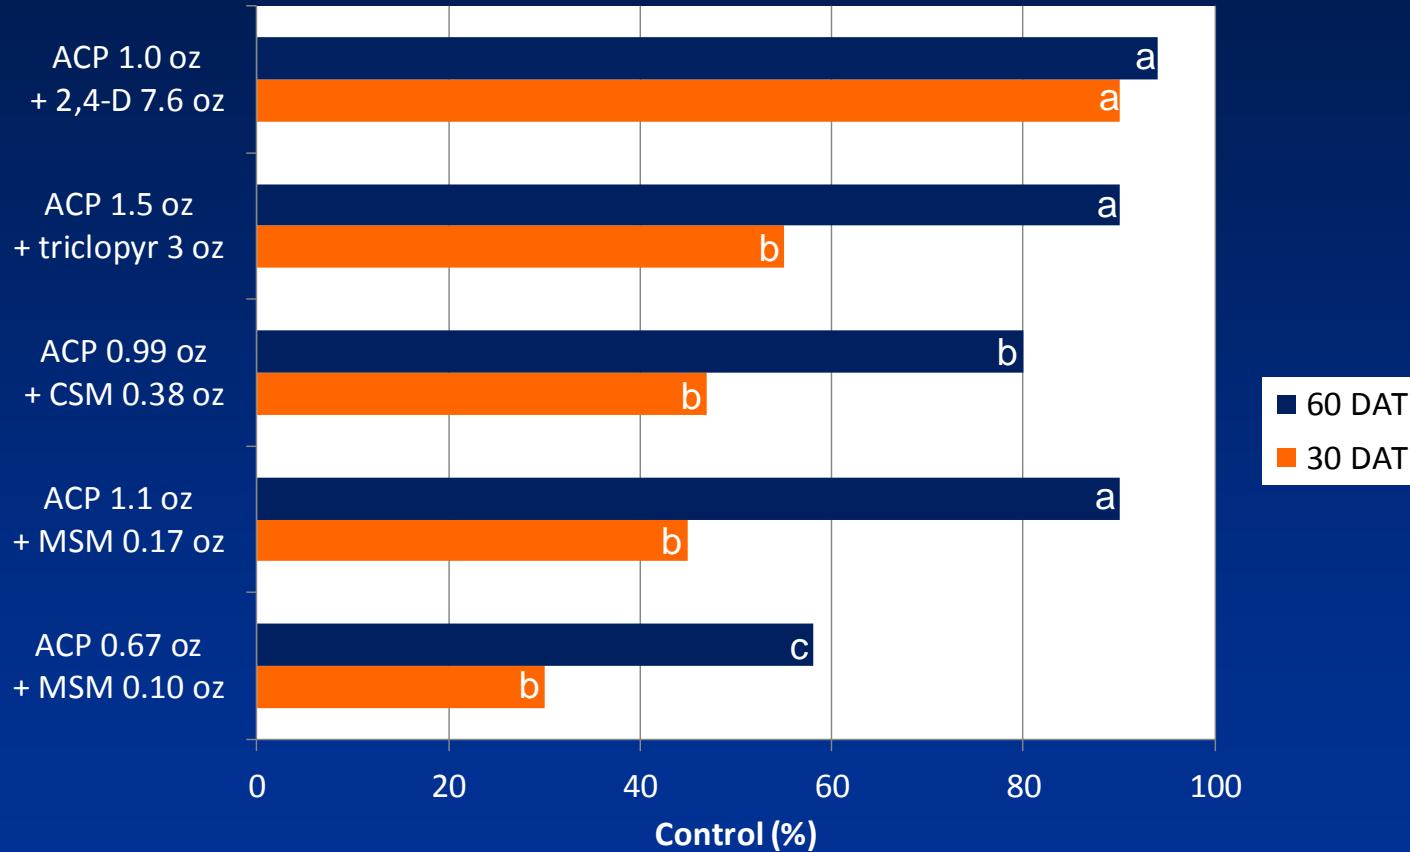

# Common Ragweed

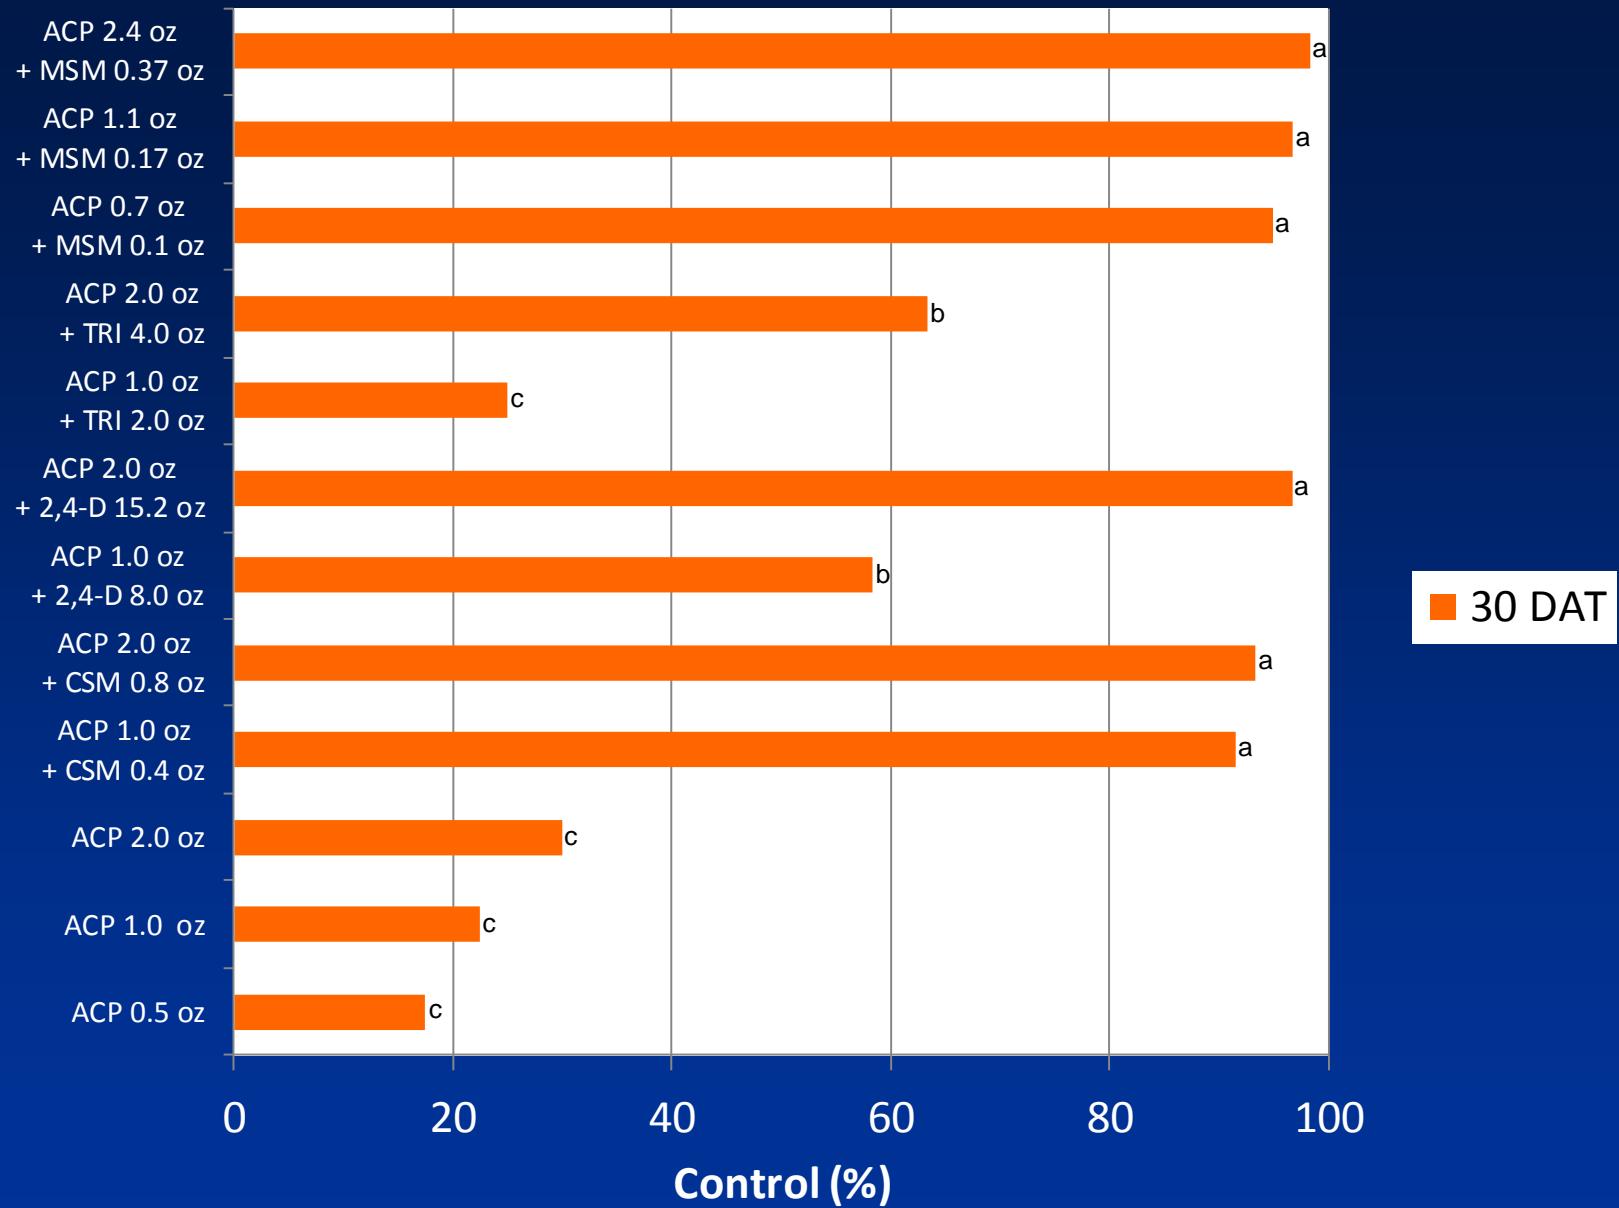

# Common Ragweed

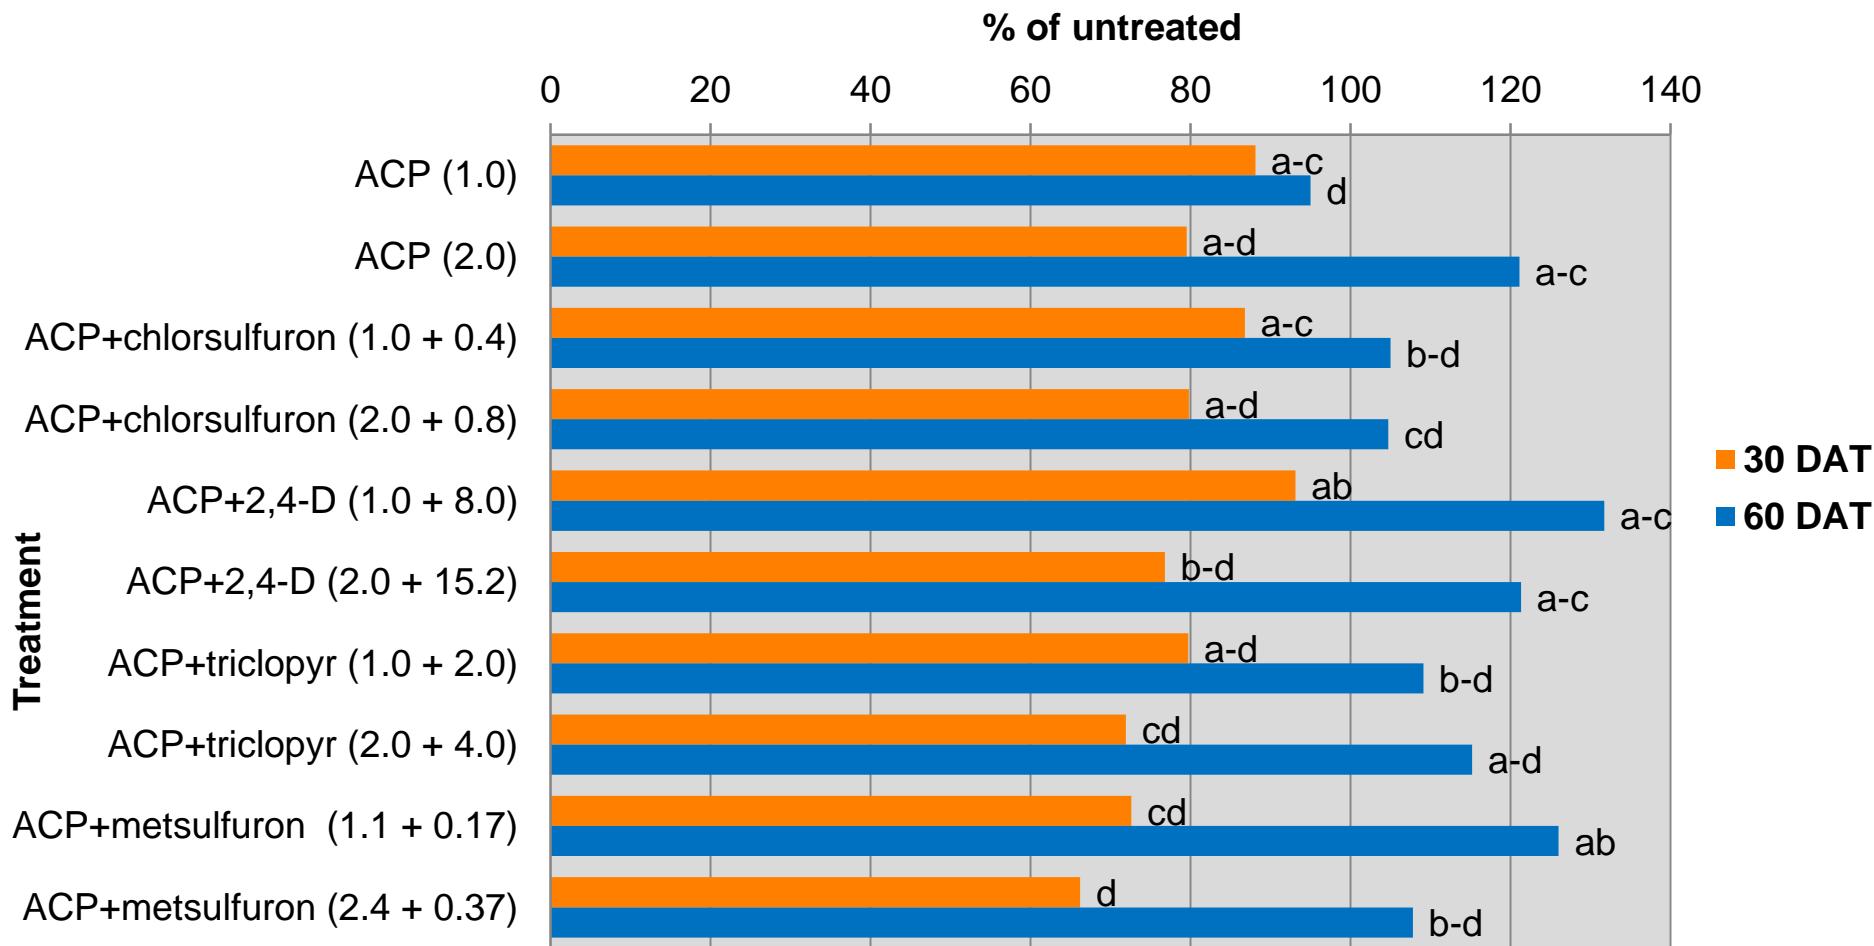

# Spiny Amaranth

# Forage Tolerance

# Response of bermudagrass to ACP and ACP premixes at 30 and 60 DAT.

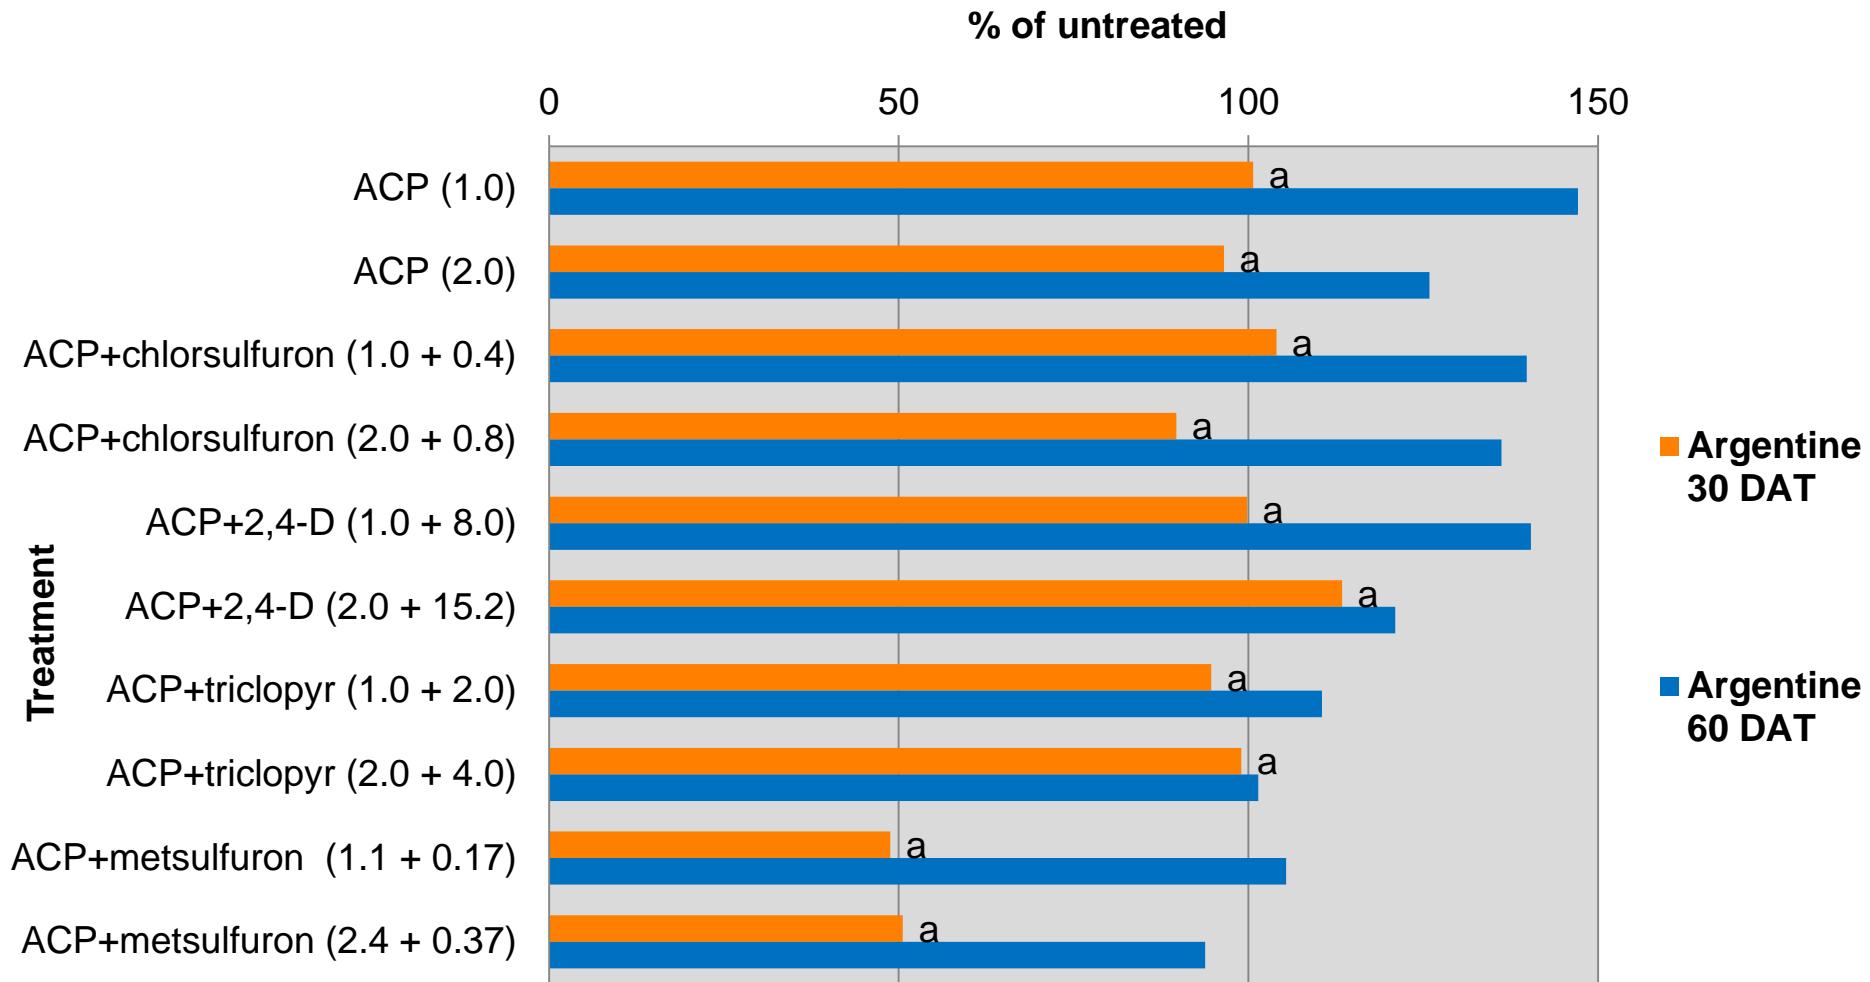

# Visual representation of Bermudagrass injury at 30 DAT

ACP (4.0)

ACP+metsulfuron (1.1 + 0.17)

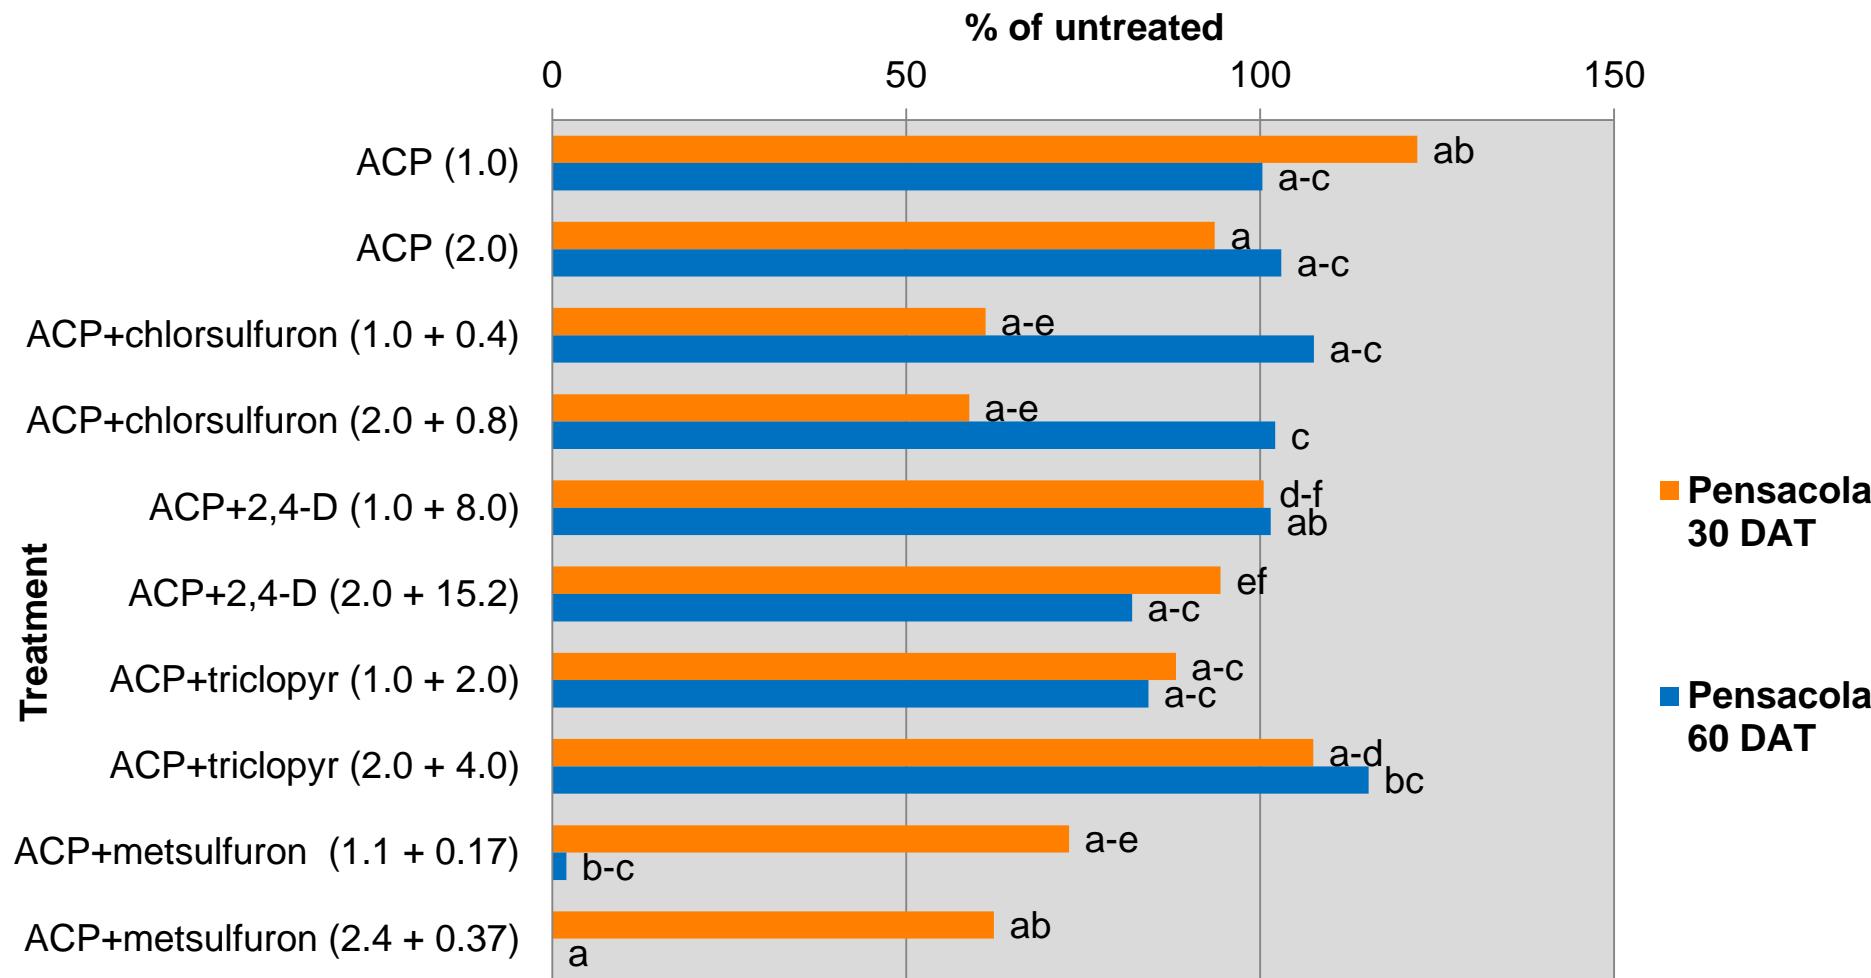

# Response of ‘Argentine’ bahiagrass to ACP and ACP premixes at 30 and 60 DAT

# Visual representation of 'Argentine' bahiagrass injury at 30 DAT

# Response of 'Pensacola' bahiagrass to ACP and ACP premixes at 30 and 60 DAT

# Visual representation of ‘Pensacola’ bahiagrass injury at 60 DAT

untreated

ACP+metsulfuron (0.7 + 0.1)

ACP+metsulfuron (1.1 + 0.17)

ACP+metsulfuron (2.4 + 0.37)

# Conclusions

- ACP at 1 oz needed for consistent dogfennel control;
  - MSM premixes=antagonism?
  - Triclopyr premix will likely be the best option
- TSA control is erratic under 2 oz ACP;
  - control appears more consistent with 2 + 4 oz ACP + triclopyr.
  - Possible antagonism with 2,4-D?
- ACP alone is not effective on St. Johns Wort, spiny amaranth, parthenium ragweed, Carolina goldenrod, but premixes tend to help.
- ACP is highly effective on common ragweed and milkpea.

# Conclusions

- ‘Argentine’ bahiagrass is among the most tolerant forage species;
- ‘Pensacola’ is tolerant to most premixes, except those containing metsulfuron, and is initially sensitive to the chlorsulfuron premix.
- Bermudagrass appears to be more tolerant to ACP premixes than stargrass.
- Bermudagrass and stargrass yields will likely recover within 60 DAT.

# Closing Thoughts

- ACP products are going to be effective on legume species
- Dogfennel control is superior with ACP, but TSA control inferior to Milestone “family”
- Other common species for control will include lantana and paw paw
- Forage tolerance may be an issue in some circumstances
- The premixes containing triclopyr and 2,4-D amine may be most useful for Florida
