# Harvesting

---

---

**Target: 30-36% Dry Matter**

---

## **Too early < 29%**

- Low Starch
- Acetic Acid > 4%
- Total fermentation acids >10%
- Seepage

## **Too late > 36%**

- Starch Digestibility
- Aerobic Stability
  - Packing
  - Lower production of acids that inhibit yeast

## **Guidelines: Harvesters Settings** *(by Mike Hutjens)*

**<33% DM**

0.75 -0.90 in. TLC  
Open rollers

**33-38% DM**

0.75 -0.90 in. TLC  
0.12 in. Rollers

**>38% DM**

0.50 in. TLC  
Close Rollers

## **Kernel Processing Improves:**

**Handling and Packing  
Starch Digestion  
Fiber Utilization  
Feed Intake  
Reduces Feed Sorting**

## **Too Much Processing:**

**Decreases effective fiber  
Favors rapid fermentation ->  
rumen acidosis**

## **Too Little Processing:**

**Kernels lost in feces  
Difficult Packing  
Sorting increased**

## Evaluate the Broken Kernels

## Guidelines:

- 90 - 95% cracked
- 70% smaller than  $\frac{1}{4}$  of a kernel

*Nicking and Crushing is not enough*

**Separate kernels in a bucket of water**

*(Mertens, 2005)*

# Face Management

# Feedout

## Feedout Losses: 1 to 10 % of DM

- Silo is exposed to oxygen
- Yeast metabolizes lactic acid
- Silage pH increases.
- Undesirable bacteria are able to grow and further spoil the silage.

# Feedout

## High Removal Rate

6-12 in./d in winter  
18 in./d in summer

In a well packed silo,  
air moves 3ft.

With a removal rate of  
6 inches/d the silo will  
be exposed to oxygen  
for a week before  
feeding.

*Muck and Huhnke, (1995)*

# Feedout

## Remove Only What Is Necessary

No silage left after feeding is done.

Minimize the time the corn silage stays in the commodity area before it is added to the ration.

# Feedout

## Smooth Face

**Prevent crack formation  
that favors air penetration**

## Tight Face

**Keep air out of the  
edges and seams**
