

Florida Meat Sheep Program: a pathway to enhanced productivity & profitability

Fernanda Rezende, PhD

Assistant Professor
Statistical Genetics and Quantitative Genomics

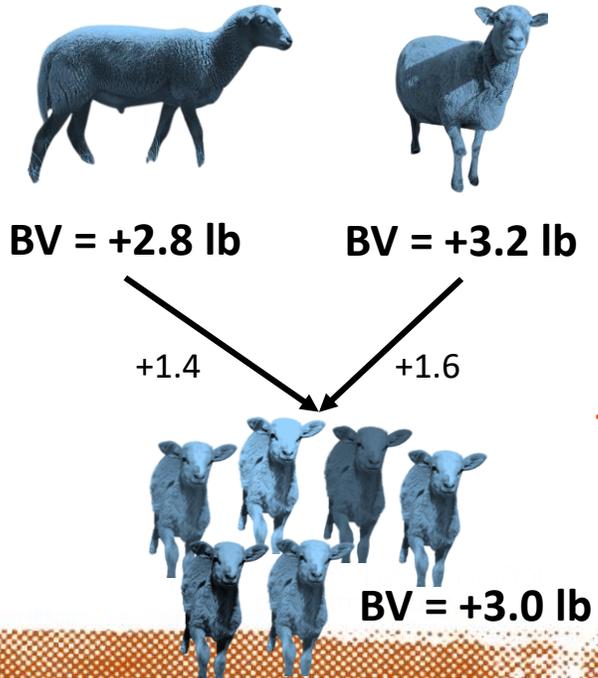

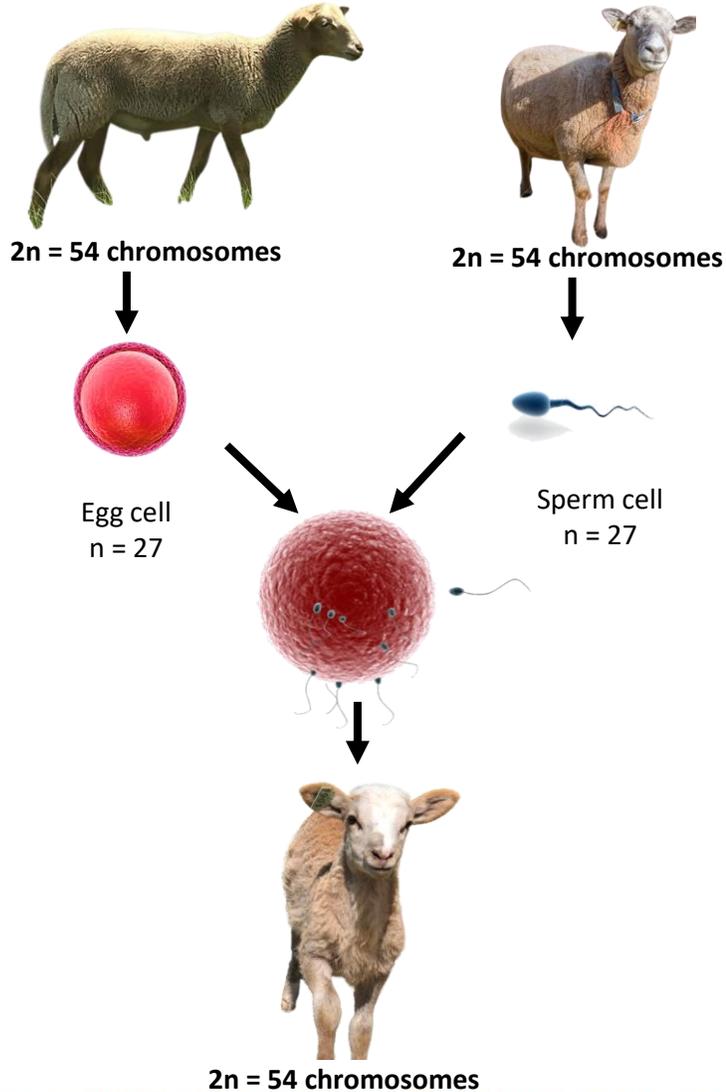

What determines animal performance?

Genetic makeup

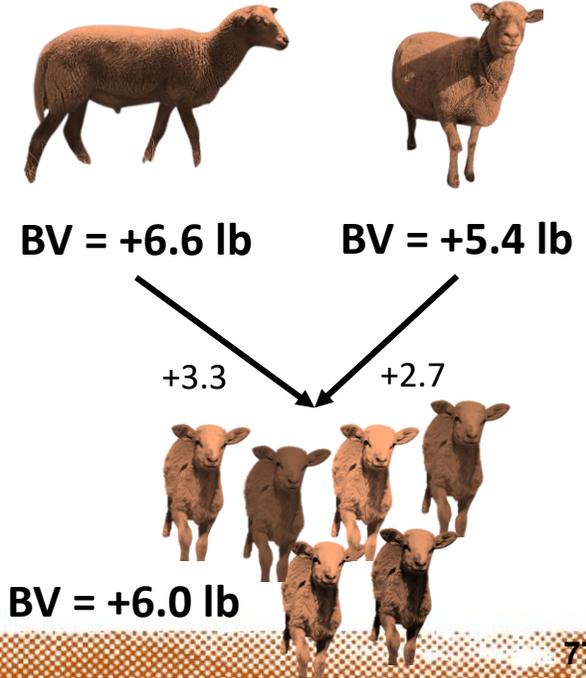

BV = breeding value

- Genetic makeup is **determined at conception**
- **Half of genetic material is inherited from each parent**
- Genetic inheritance is a **random process**
- Genetically superior parents are **more likely** to have genetically superior offspring

$$EPD = \frac{BV}{2}$$

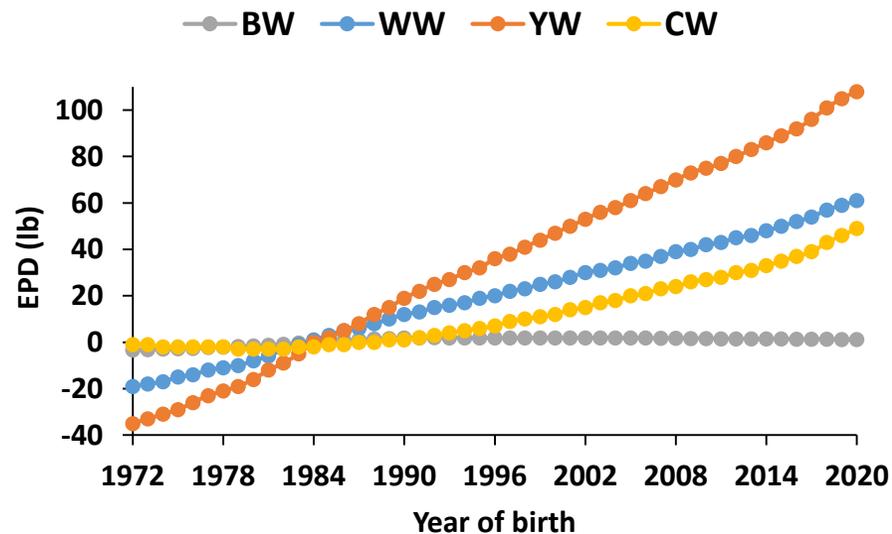

+3.0 lb at weaning due to superior GENETICS

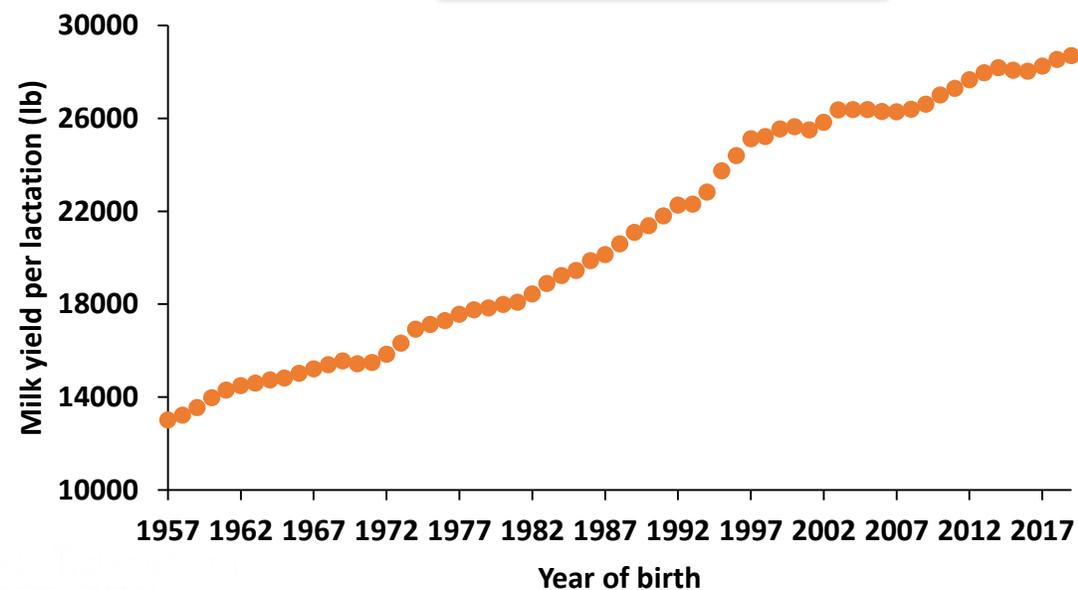

Selection and mating decisions

- Two **most important decisions** that a producer frequently makes
- Represents a great **opportunity to improve the profitability** of the sheep enterprise
- Changes achieved through **selection** are **incremental**, **cumulative** and **permanent**

Angus beef cattle

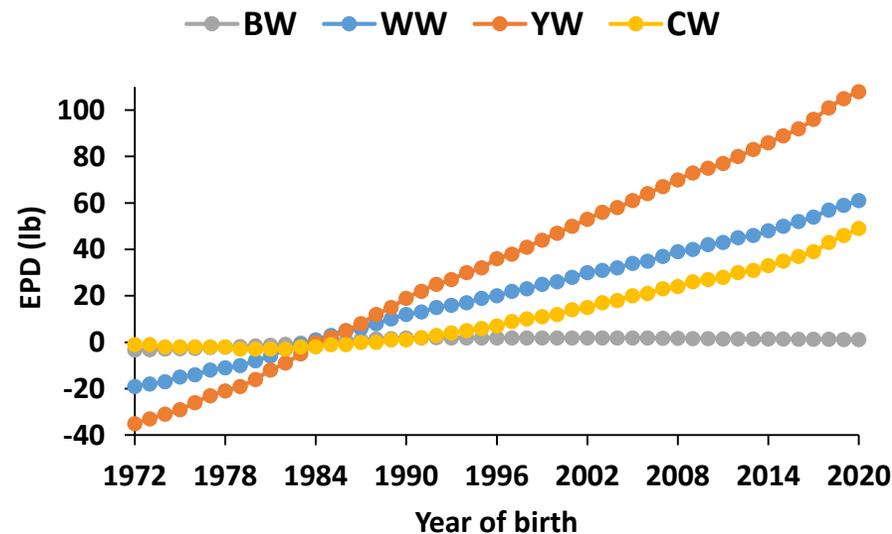

Holstein dairy cattle

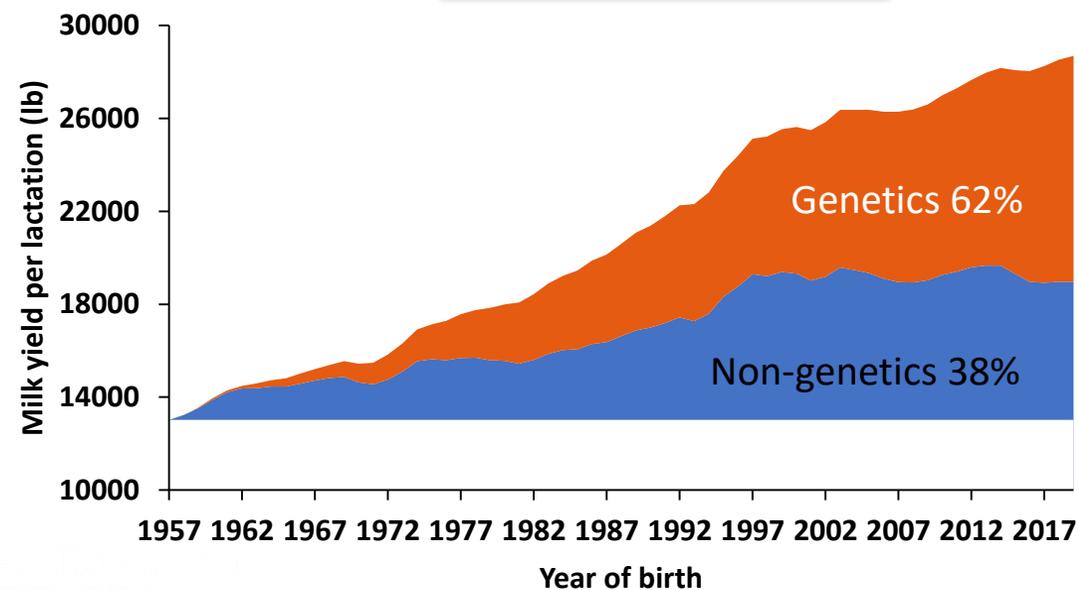

Selection and mating decisions

- Two **most important decisions** that a producer frequently makes
- Represents a great **opportunity to improve the profitability** of the sheep enterprise
- Changes achieved through **selection** are **incremental**, **cumulative** and **permanent** -> **cost-effective**

Angus beef cattle

Selection and mating decisions

- Two **most important decisions** that a producer frequently makes
- Represents a great **opportunity to improve the profitability** of the sheep enterprise
- Changes achieved through **selection** are **incremental**, **cumulative** and **permanent** -> **cost-effective**
- **Mating** decisions have direct impact in the **variation of the offspring**

Within breed

Crossbreeding

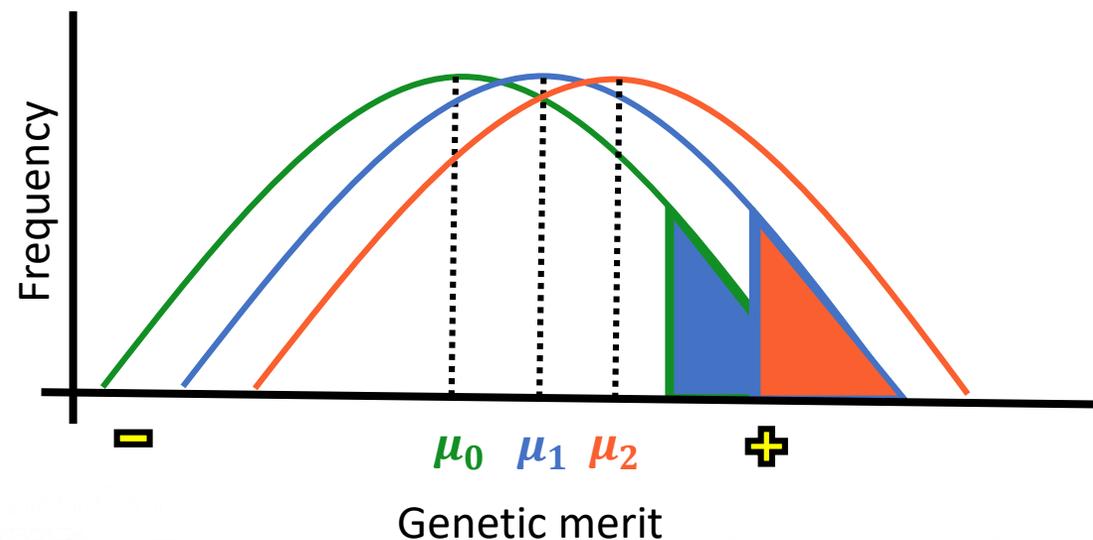

Selection and mating decisions

- Two **most important decisions** that a producer frequently makes
- Represents a great **opportunity to improve the profitability** of the sheep enterprise
- Changes achieved through **selection** are **incremental**, **cumulative** and **permanent** -> **cost-effective**
- **Mating** decisions have direct impact in the **variation of the offspring**

Mating the “best” to the “best”
as quickly as possible
 is the basic principle of making
 genetic progress in a population

$$\Delta G = \frac{\text{genetic superiority of selected parents}}{\text{generation interval}}$$

ΔG = rate of the genetic gain

Will you choose the right ram?

Performance records (pounds)	
	9moW
RAM 1	120.3
RAM 2	118.4
RAM 3	125.6
RAM 4	130.2

Will you choose the right ram?

Raising and management information						
	Twin	Mature ewe	Creep feeding	Disease	Dewormed	Only pasture
RAM 1	✓		✓			✓
RAM 2				✓	✓	
RAM 3	✓	✓	✓			✓
RAM 4		✓			✓	

Will you choose the right ram?

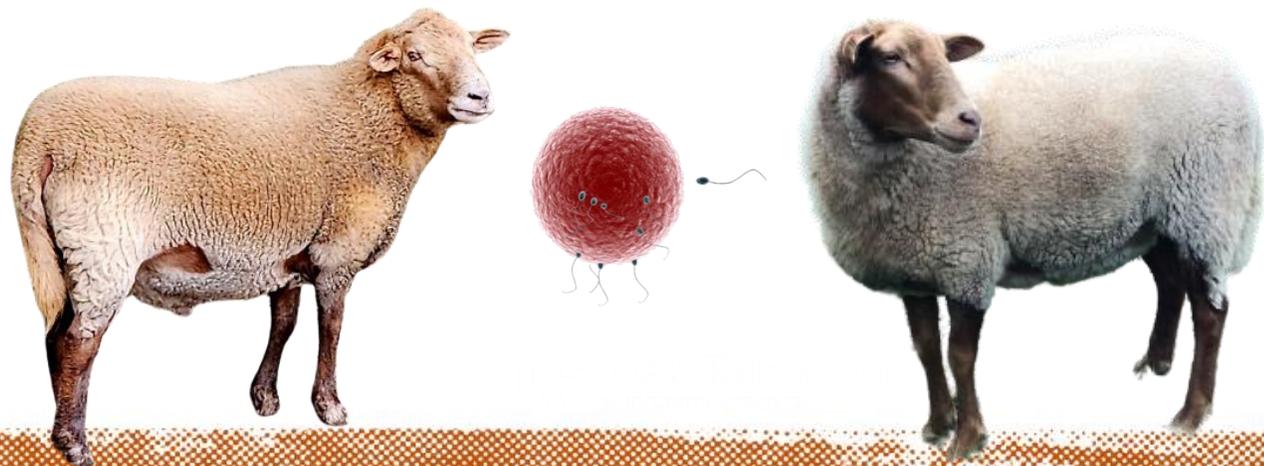

Genetic merit (BV = breeding value)					
	BW	MWW	WW	PWW	YW
RAM 1	0.7	1.8	2.6	5.6	6.3
RAM 2	0.5	2.5	3.4	4.9	5.8
RAM 3	1.2	1.5	4.3	7.5	8.2
RAM 4	0.4	2.2	3.1	6.2	7.9

BW: birth weight
MWW: maternal weaning weight
WW: weaning weight
PWW: post-weaning weight
YW: yearling weight

The protagonists: rams and ewes

- They are our “machines” to produce gametes
- Rams and ewes have the important role of **disseminating genetic material** for the next generation
- Both **must be selected by** and **are worth** the **average value of their gametes**
- **Genetic selection** is the method by which the producer identifies individuals with **more desirable traits**, and **only those** are **allowed to reproduce**

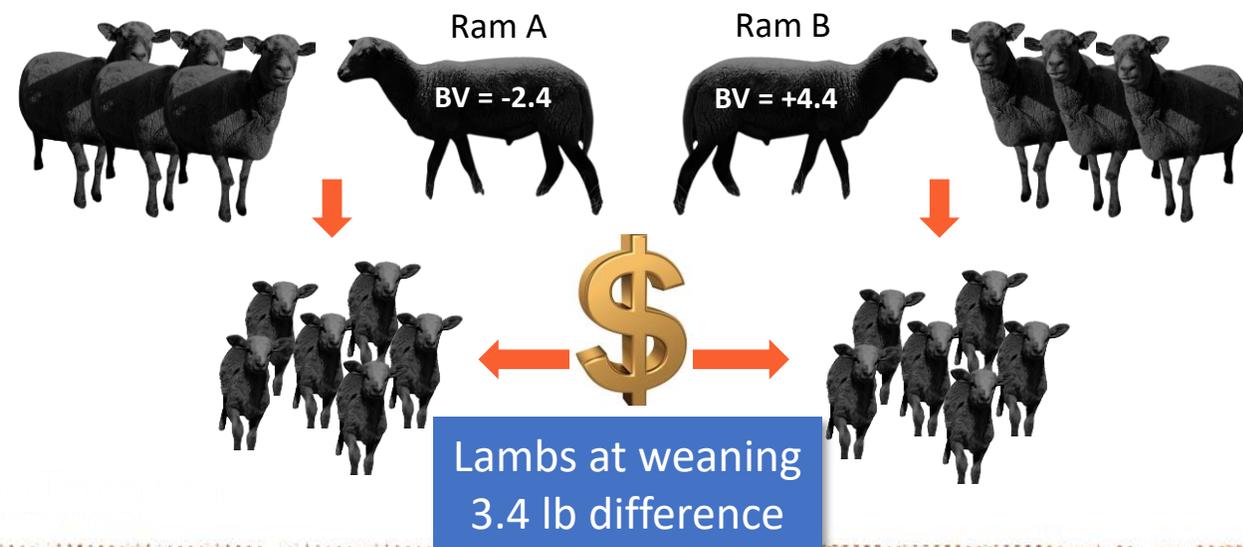

Expected progeny difference (EPD)

$$EPD = \frac{BV}{2}$$

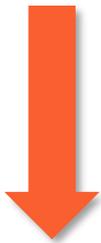

- Estimate of the relative **genetic superiority that an animal will pass down to its offspring**
- EPD is an exceptional **tool for comparing and ranking** animals
- We should **always use EPD** when making **selection decisions**
- The **difference between the EPDs** of two rams is an **estimate of the difference** we expect to observe in the **performance of their progeny**

RAM 2 vs RAM 1 profitability
 20 progeny/year, 2 years in service,
 \$4 per pound of weaned lamb

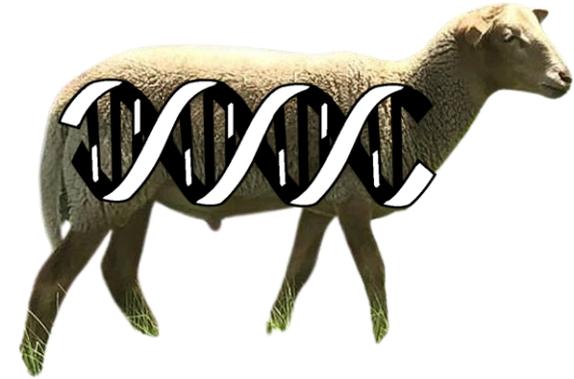

Genetic evaluation

Performance records
Pedigree
(Genetic markers)
Raising conditions
Contemporary group

Estimation of
breeding values

Breeding values (BV) are
the BEST prediction of
animals' genetic merit for
a particular trait

Breeding values (BV) are an
indication of how an animals'
progeny will perform

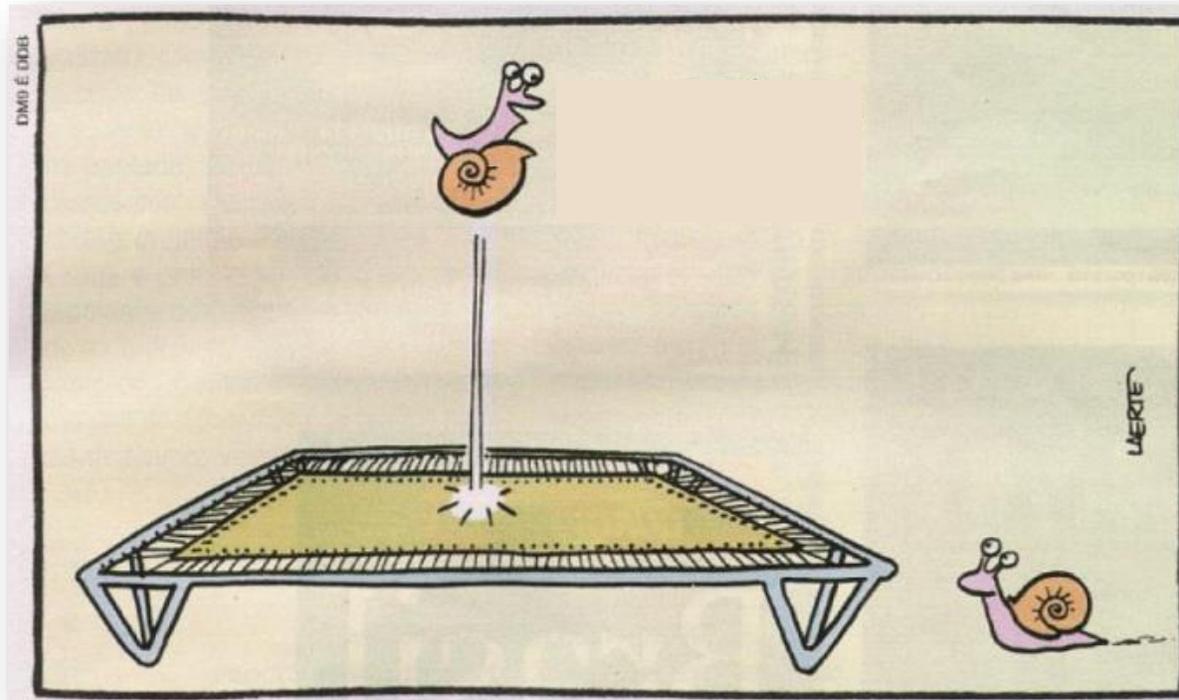

Benefits of genetic evaluation

- Facilitates identification of **genetically superior rams and ewes earlier in life**
- Allows **comparison across flocks**
- Supports more **assertive selection, culling and mating decisions**
- Allow **custom selection and mating criteria**
- Improves flock **management and traceability**
- Promotes **faster genetic progress**
- **Science-based methods**
- **Industry-tested approach**
- Enhances animals' **marketability**
- **Sales and purchases** based on numbers
- Benefits have **impact on the entire sheep industry**

**Breeding programs seem to be challenging at first,
but are rewarding once you start seeing the results**
